The invention relates to an isolated nucleic acid molecule comprising a nucleotide sequence that encodes a Hong Kong New Gene (HKNG) 1 gene product. The human gene for HKNG1 is located on chromosome 10g in an area associated with bipolar affective disorder, Bab. Also included are an expression vector comprising the nucleic acid, a host cell expressing the nucleic acid, an anti-HKNG1 antibody, a method of identifying modulators of HKNG1, and identifying an individual (at risk of) having HKNG1 mediated disorder comprising detecting the presence or absence of a polymorphism that correlates with an HKNG1 allele associated with the disorder, where the presence of the polymorphism indicates that the individual (is at risk of) having HKNG1 mediated disorder. A (small
                                                                                                                                                                                                                 New nucleic acid molecule Hong Kong New Gene 1 (HKNG1), useful for screening for molecules which modulate HKNG1 expression for the treatment of bipolar disorder and schizophrenia.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            molecule) compound which modulates (inhibits or potentiates) expression of a HKNG1 gene or gene product in a human individual is useful for the treatment of a HKNG1-mediated disorder such as bipolar affective disorder (BAD), severe bipolar affective (mood) disorder (BP-I) and schizophrenia. The present sequence is PCR primer which amplifies a HKNG1 exonic
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Caspase 7; antisense modulation; antiinflammatory; cytostatic; antisense therapy; caspase 7 inhibitor; inflammatory condition; hyperproliferative disorder; cancer; bone metabolism; infection; cholesterol disorder; inflammation; tumour; phosphorothioate; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         .

The present invention describes a compound (I) 8-50 nucleobases in length targeted to a nucleic acid molecule encoding caspase 7, which specifically hybridises with and inhibite the expression of caspase 7.

(I) has antinifiammatory and cytostatic activities, and can be used in antisense therapy and as an inhibitor of caspase 7 expression. (I) is useful for inhibiting the expression of caspase 7 in human cells or tissues, and for treating a human having a disease or condition.

(Byerprolificative disorder (cancer), or bone metabolism or cholesterol hyperprolificative disorder (cancer), or bone metabolism or cholesterol cascarch reagent and kits. (I) is useful prophylactically to prevent or delay infection, inflammation or tumour formation. The present sequence represent a mouse caspase 7 inhibiting chimeric phosphorothicate colligonucleotide having 2-MOE wings and a decoxy gap, which is used in an example from the present invention
                                                                                                                                                                                                                                                                                                                     Novel antisense compounds targeted to nucleic acids encoding caspase 7, for modulating gene expression and treating diseases associated with expression of caspase 7 in humans.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Caspase 7; antisense modulation; antiinflammatory; cytostatic; antisense therapy; caspase 7 inhibitor; inflammatory condition; hyperproliferative disorder; cancer; bone metabolism; infection; cholesterol disorder; inflammation; tumour; phosphorothioate; sa

The present invention describes a compound (I) 8-50 nucleobases in length targeted to a nucleic acid molecule encoding caspase 7, which specifically hybridises with and inhibits the expression of caspase 7.

(I) has antiinflammatory and cytostatic activities, and can be used in antisense therapy and as an inhibitor of caspase 7 expression. (I) is useful for inhibiting the expression of caspase 7 expression. (I) is useful for inhibiting the expression of caspase 7 in human cells or useful for inhibiting a disease or condition associated with caspase 7 including inflammatory condition.

(byperproliferative disorder (cancer), or bone metabolism or cholesterol disorder. (I) is useful for diagnostics, therapeutics, prophylaxis and as research reagent and kits. (I) is useful prophylactically to prevent or delay infection, inflammation or tumour formation. The present sequence oligonucleotide having 2. MOE wings and a decoxy gap, which is used in an example from the present invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Human, Von Willebrand factor-cleaving protease; vWF-cp; therapy; enzyme; transgenic animal; immunisation; thromboembolic disease; preeclampsia; thrombotic thrombocytic purpura; TTP; Henoch-Schonlein purpura; thrombosis; neonatal thrombocytopeania; haemolytic-uraemic syndrome; transgenic; anticoagulant; RT-PCR; primer; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                             Novel antisense compounds targeted to nucleic acids encoding caspase 7, for modulating gene expression and treating diseases associated with expression of caspase 7 in humans.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Human Von Willebrand factor-cleaving protease cloning PCR primer, 6395.

The invention relates to an isolated or substantially pure Von Willebrand factor-cleaving protease (vWF-cp) polypeptide. vWF-cp is useful for purifying vWF which involves providing vWF-cp as a ligand, contacting a solution comprising vWF with the polypeptide ligand under conditions where vWF is bound to the ligand and recovering from the ligand purified vWF- vWF-cp is useful for producing anti-vWF cp polypeptide antibodies vWF vWF-cp is useful for producing anti-vWF cp polypeptide antibodies which involves immunising an animal with vWF-cp and isolating the anti-vWF cp polypeptide antibodies from the animal. vWF-cp is useful for producing a preparation of prophylaxis and therapy of thrombosis and thrombombombolic disease such as thrombocic thrombocytopaenia or preducing a preparation of prophylaxis and therapy of thrombosic and thrombocytopaenia or haemolytic-uraemic syndrome. vWF-cp can also be used for processing plasmatic or recombinantly produced vWF. The invention is useful for construction expression systems and generating transgenic animals which express the polypeptide in vivo. The present sequence is human vWF-cp gene cloning RT-PCR primer
                                                                                                                                                                                                                                                                                                                                                                  Novel isolated or substantially purified Von Willebrand factor-cleaving protease, useful for producing preparation for therapy of thrombosis and thromboembolic disease such as thrombotic thrombocytic purpura.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Human, PCR primer; identification; tumour senescence; cytotoxic; ss;

The present invention describes a method for identifying a compound that induces senescence in a mammalian cell comprising culturing the cell in the presence and absence of the compound, assaying expression of at least con collular gene (Gla) from 56 or agene (G2) from 64 genes, with corresponding accession numbers given in the specification, and identifying compounds that induce senescence when expression of (Gla) or expression of (G2) is lower, in the presence of the compound Also described: (1) a compound that induces senescence in a mammalian cell; (2) assessing efficacy of a treatment of a disease or condition relating to abnormal cell proliferation or neoplastic cell growth; or (4) identifying a compound that inhibits senescence—associated induction of cellular gene expression or neoplastic cell growth; or (4) identifying a compound that inhibits is useful for treating or for assessing efficacy of treatment of a lisease or condition relating to abnormal cell proliferation or senescence—associated inducing of the invention has a growth—inhibitory effect without producing systemic side effects found with other growth—inhibitory compounds. ABQ74611 to ABQ74734 represent PCR primers which are used in an example from the present invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Human; mouse; HYPLIP1; FCHL1; familial combined hyperlipidaemia; cancer;
                                                                                                                                                                                                                  Identifying a compound that induces senescence in a mammalian p53 deficient or tumor cell comprises assaying expression of cellular genes in the presence of the compound with expression of the genes in the absence of the compound.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Query Match 0.8%; Score 13.6; DB 1; Length 20; Best Local Similarity 80.0%; Pred. ```
The invention relates to an isolated polynucleotide comprising a sequence variation of a mouse HYPLIP1 CDNA or a human FCHL1 (familial combined hyperlipidaemia) gene. The FCHL1 polynucleotide, the FCHL1 polypeptide or antibody immunoreactive to the FCHL1 polypeptide are useful for treating or preventing cancer associated with expression of FCHL1, as well as for treating lipid disorder. The mouse HYPLIP1 cDNA or human FCHL1 gene are also useful for diagnosing or prognosing a predisposition to lipid disorder and cancer. ABK70902-ABK71303 represent mouse HYPLIP1, human FCHL1 coding sequences and PCR primers of the invention
                                                                                      New mouse HYPLIP1 and human FCHL1 (familial combined hyperlipidemia) genes and their sequence variations, useful for diagnosing, treating or preventing lipid disorders and cancers.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Modified antisense oligonucleotide; antisense; HIV; cancer; infection; cytostatic; virucide; anti-HIV; hepatotropic; antiinflammatory; phosphorothioate backbone; integrin; cell-cell adhesion receptor; ss.

The invention relates to a novel isolated nucleic acid molecule comprising a sequence that encodes a thioesterase or thioesterase domain,
                                                                                                                      The present invention relates to novel antisense oligonucleotides which are targetted to nucleic acids encoding human raf proteins and capable cinhibiting raf expression. The invention also relates to methods of inhibiting hyperproliferation of cells which involves contacting the hyperproliferation of cells which involves contacting the hyperproliferating cells with a therapeutically effective amount of an oligonucleotide of the invention. The method is useful for treating cancer, angiogenesis or neovascularisation, especially ocular angiogenesis or neovascularisation. The present DNA sequence is an antisense oligonucleotide targetted to human c-raf kinase
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Isolated nucleic acid molecule from a bacterial daptomycin biosynthetic gene cluster encoding a thioesterase or thioesterase domain, useful for generating novel linear and cyclic peptides, and products in a cell.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Daptomycin biosynthetic gene cluster; thioesterase; antibacterial; fundicide; virucide; antiparasitic; immunomodulator; antilipemic; cytostatic; gene therapy; antimitotic; immunomodulatory; siderophore; anti-cholesterolemic; agrochemical; linker; PCR; primer; ss.
                                             Treating cancer, angiogenesis or neovascularization by administering antisense oligonucleotides targeted to human raf sequences.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   S. roseosporus daptomycin biosynthetic gene cluster PCR primer P92.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           g
                                                                                                                                                                                                                             The present invention relates to oligonucleotides having at least one non-terminal pyrimidine nucleoside modified and additionally having the 5'-and/or 3'-terminal modified. These can be used in the treatment of viral infections, such as HIV, HSV-1, HSV-2, influenza virus, VSV, hepatitis B and papilloma viruses, cancer and diseases involving integrins and cell-adhesion receptors. The present sequence is an antisense oligonucleotide of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Human; raf; hyperproliferation; neovascularisation; ocular angiogenesis;

derived from a bacterial daptomycin biosynthetic gene cluster. The proceins of the invention have antibacterial, fungicide, virucide, antiparasitic, immunomodulator, antilipemic, and cytostatic activity. The polynucleotides may have a use in gene therapy. The compositions and methods of the present invention are useful for generating novel linear and daptomycin non-ribosomal peptide synthetase (NRPS) to be used as new compounds or in producing new compounds, such as antibiotics, antifungals, antivirals, antiparasitics, antimitotics, antitumour agents, immunomodulatory agents, anti-cholesterolemic agents, addrophores, agrochemicals and cytostatics. The sequence represents a PCR primer used in the invention to amplify the S. roseosporus daptomycin biosynthetic gene cluster from a BAC library

This invention describes novel human NOVX polypeptides which have cytostatic, cardiant, antiarteriosclerotic, antiasthmatic and hypotensive activity. Pharmaceutical compositions comprising the NOVX proteins or nucleic acid molecules or NOVX antibodies are useful for preventing or treating a disorder associated with aberrant NOVX expression or activity e.g. cancer, hypotension, atherosclerosis, cardiomypathy or bronchial asthma. The products of the invention can be used for gene therapy or in a vaccine. ABX13460-ABX13462 and ABX97186-ABX97593 represent PCR primers and probes used in the amplification and isolation of the NOVX polymeted polymucleotides represented in ABX97088-ABX97185 which encode the

The invention relates to a composition (I) comprising AGP-3 receptor (tumour necrosis factor ligand family member) related protein (II) attached to a vehicle protein. (I) is useful for modulating AGP-3-related activity in mesanteric lymph nodes (MLN) of a mammal. (II) is useful in assays to identify cells and tissues that express AGP-3R or proteins related to AGP-3R related protein and for identifying compounds (agonists or antagonists) that interact with AGP-3R proteins. (II) is also useful for identifying intracellular proteins that interact with the respective cytoplasmic domains by yeast two-hybrid screening process. (II) is also useful for identifying intracellular proteins that interact with the respective cytoplasmic domains by yeast two-hybrid screening process. (II) is also useful in lymph node, spleen, and Peyer's patches. AGP-3R agonists and antagonists involved using (II) are used for modulating B cell response and are used to treat disease characterised by inflammatory processes or deregulated immune response such as rheumatoid arthritis, graft-versusches to the hybridoma cells which are derived from B cells, which involves treating the hybridoma cells with (II). (II) is useful in the production of hybridoma cells with (II). (II) is useful in the treating the hybridoma cells with (II). (II) is useful in the creating the phorized procession of joines or antagonists are useful for treating the phorized that, amportophic lateral sclerosis (ALS). Alzheimer's disease, asthma, atherosclerosis, cachexia/anorexia, isochaemic injury including crebral ischaemia, multiple myeloma injury, celerosis, parkinson's disease, pain, reperfusion injury, dermatclogical; neuroprotective; noctropic; immunomodulator; metabolic; antidabetic; analgesic; nephrotropic; osteopathic; cytostatic; fever; antidabetic; analgesic; nephrotropic; osteopathic; cytostatic; fever; AGP-3 receptor; tumour necrosis factor ligand family; AGP-3 receptor; mesenteric lymph node; AGP-3R; inflammatory disease; immune disorder; rheumatorid arthritis; graft-versus-host disease; Crohn; s disease; pancreatitis; amyotrophic lateral sclerosis; ALS; Alzheimer's disease; diabetes; glomerulnosphiclas, inflammatory bowel disease; ischaemia; ss; multiple sclerosis; Parkinson's disease; transgenic animal; PCR primer. Composition, useful for identifying modulator of receptor for treating asthma and glomerulonephritis, comprises AGP-3 (tumor necrosis factor ligand family member) receptor and encoding nucleic acids. Sequences ABL94252-ABL94476 represent antisense oligonucleotides targeted to the human or mouse CCAAT/enhancer-binding protein alpha (C/EBP alpha) gene, which inhibit its expression. The antisense oligonucleotides were designed to target different regions of the human and/or mouse C/EBP alpha RNA, and were analysed for their effect on C/EBP alpha mRNA levels by quantitative real-time PCR. The C/EBP family of proteins are a family of transcription factors which regulate the expression of a wide range of genes that control normal tissue development, cellular function, cellular proliferation and functional differentiation. C/EBP beta (alabo known as C/EBP2. LAP, TCFS, CRE2, NFL6, ILGDBP, WF-W, AGP/EBP and Apc/EBP) or marily regulates hormone responsiveness and oxidative stress responses or is a mediator of IL-6 (interleukin-6) signaling. C/EBP beta is thought to be involved in carbohydrate metabolism, immunity, the Th1 response, female fertility and gluconeogenic pathways. C/EBP beta is thought to be involved in carbohydrate metabolism, immunity, and testis, with the highest expression found in the lung. It is also expressed at a higher liques expression in pancreas is upregulated in response to chronically elevated levels of glucose, indicating that it is involved in the invention are useful for diagnosis, prevention and treatment of impairment of insulin secretion in type II diabetes. The oligonucleotides conditions associated with C/EBP beta expression, such as cancer (particularly ovarian cancer), tunder formation, diabetes (particularly version, or inflammation
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Sequence 20 BP; 2 A; 8 C; 7 G; 3 T; 0 U; 0 Other;

Screening substances inhibiting the binding of signal-transducing molecule to KDR/Flk-1 phosphorylated at tyrosine at 1175-position, as cell proliferation inhibitors and angiogenesis inhibitors for treatment

```
The invention relates to inhibiting the signal transduction of KDR/FIk-1 (kinase insert domain-containing receptor/fecal liver kinase-1) is by using a substance inhibiting the binding of a signal-transducing molecule to KDR/FIk-1 phosphorylated at tyrosine at the 1175-position. Also included are methods of detecting/inhibiting/screening for cell collecteration, angiogenesis, KDR/Fik-1 signal transduction and KDR/FIk-1 phosphorylation at tyrosine at the 1175-position using the binding inhibitors, compounds obtained by the screening methods, drugs containing the inhibitors, a monoclonal antibody or its fragment recognishing KDR/FIK-1 phosphorylated at tyrosine at the 1175-position, a DNA encoding the company and atransformant obtained by transferring the recombinant vector containing the nost cell. The method is useful for screening substances into a host cell. The method is useful for screening substances inhibitors and anglogenesis inhibitors for treatment of e.g. tumour, diabetic omentopathy and chronic rheumatoid arthritis. A method for cetecting anglogenesis is also provided. The present sequence is a PCR to Phe

Designing capture oligonucleotide probes for use on a support to which complementary oligonucleotides hybridize with little mismatch.

5; Fig 29; 300pp; English Example

The present invention describes a method (M1) for designing capture oligonuclectide probes (I) for use on a support to which complementary oligonuclectide probes (II) will hybridise with little mismatch, where (I) have melting temperatures within a narrow range. The method is useful for detecting infectious diseases caused by bacterial infectious agents e.g. Carptococcus neoformans, Candida albicans and infectious agents e.g. Cryptococcus neoformans, Candida albicans and Aspergillus fumigautus, viruses e.g. T-cell lymphocytocrophis cirus, Epstein-Barr virus and pollovirus, and parasific infectious agents selected from Onchoverva volvulus, Entameeba histolytica and Dracunculus medinesis. The method is also useful for detecting genetic diseases such as 21 hydroxylase deficiency, Turner Syndrome and obesity defects. Detecting cancer involving oncogenes, tumour suppressor genes, or genes involved in DNA amplification, replication, recombination or repair, the cancer is specifically associated with a gene selected from BRCA1 gene, particular sites and infrared microscope of the support at the food and fedetifying if ligation of the oligonucleotide probe particular sites and infrared microscope) the support at the parence or absence of the target mucleotide sequences. Bilazotot to a presence or absence of the target mucleotide sequences in the exemplification of the oligonucleotide sequences used in the exemplification. of the present invention

Novel isolated human peptide histidine transporter which facilitates peptide transport across cell membranes in gastrointestinal tract, useful as target for evaluating peptide and peptide-based drug transport.

Example 2; Page 55; 95pp; English.

The present invention relates to nucleic acid sequences encoding human

peptide histidine transporter 1 (hPHT1) protein, the hPHT1 proteins and methods for using them. The nucleic acid sequences of the invention are is useful for screening a test compound for human PHT1 modulating activity. The hPHT1 proteins are useful as a target for evaluating crivity. The hPHT1 proteins are useful as a target for evaluating peptide and peptide-based drug transport. The functional characterisation of the hPHT1 proteins are useful as a target for evaluating particular substrate to the molar expression level of hPHT1 provides crucial information regarding the ability of this transporter to facilitate the uptake and transport across cell membranes in the PHT1 proteins facilitate poptide transport across cell membranes in the gastrointestinal tract and other organs in which they are expressed. The identification of full length hPHT1 close facilitates the development of optimal peptide-based drugs for tracting patients with hPHT1-related diseases. AAS20878-AAS20911 represent reverse transcriptase (RT)-PCR primers used in the methods of the present invention 8888888888888888888

and TG-Y Nucleic acids which encode novel transglutaminase enzymes TG-Z which can be used in diagnostic methods of autoimmune diseases.

Disclosure, Page 27; 67pp; English.

The invention relates to nucleic acids which encode novel polypeptides having transglutaminase activity. The compositions of polypeptide are useful for transamidation reactions on peptides and polypeptides.

schultz621-3.rng

Detection of the polypeptides with transglutaminase activity are useful in a subject or in cells derived from a subject having an autoimmune disease. The method for detecting transglutaminase proteins may be used to diagnose autoimmune diseases which include Addison's disease, Al haemolytic anaemia, Al thrombocytopenic purpara, Al thyroid disease, atrophic gastritis, permicione, IgA nephropathy or IgG disease, colitis ulcerosa, Goodpasture syndrome, IgA nephropathy or IgG glomerulonephritis, mysathenia gravis, partial lipodystrophy, polymyositis, primary biliary dirthosis, primary sclerosing cholangitis, progressive systemic sclerosis, recurrent pericarditis, relapsing propracy polymyositis, phenumatoid arthritis, rheumatism, sarcoidosis, Sjogren's syndrome, SiE, splenic atrophy, type I (insulin-dependent) diabetes mellitus, Wegener granulomatosis, ulcerative colitis, vasculitis (both syndromic attorned) and vitiligo. This sequence represents a primer used in the study of transglutaminase genes in which DNA, amino acid sequence. determined

Benning C, Cernac A; WPI; 2002-713509/77. New isolated lipid metabolism regulator nucleic acid, useful for producing transpent plants having modified level of seed storage compound, e.g. lipids for generating seed oils which have the ability of reducing risk of heart disease.

Example 2; Page 34; 72pp; English.

The present sequence is that of a primer for an AINTEGUMENTA-like protein gene of Arabidopsis thallana. Overlapping PCR primers (see ABG1398-407) were used in amplification and sequencing reactions to identify sequence changes in 2 wril mutants compared to wild-type sequences in order to identify the true wril gene. In subsequent experiments, wril mutants were complemented with cosmids containing wild-type genomic DNA, and PCR was used to produce a full-length wril cDNA (see ABG81395) encoding a lipid

New recombinant expression construct, useful for identifying compounds that inhibit the induction of genes induced by cyclin-dependent kinase inhibitors for preventing or treating cancer, renal failure or Alzhaimer's disease.

Example 11; Page 133; 137pp; English.

The present invention relates to a recombinant expression construct encoding a reporter gene operably linked to a promoter from a mammalian gene induced by a cyclin-dependent kinase (CDK) inhibitor. The construct is useful for identifying compounds that inhibit the induction of genes induced by CDK inhibitors. The compounds are useful for preventing or treating a disease caused by CDK inhibitor induced gene expression, e.g. cancer other than colon cancer, renal failure, Alzheimer's disease, amyloidosis, age-related diseases, atherosclerosis or arthritis. The present sequence is a PCR primer used to amplify a human promoter suitable for use in the construct of the invention

The invention relates to a method of measuring beta 1,4-N-acetylgalactosaminyltransferase (GD2/GM3 synthase) mRNA. The method involves obtaining an mRNA sample, performing real-time quantitative reverse transcriptase-polymerase chain reaction (RT-PCR) on the sample using appropriate primers of GD2 synthase, and determining the amount of GD2 mRNA. The methods and kits are useful for detecting and/or diagnosing various forms of cancer such as neuroblastoma, melanoma, B cell lymphoma, osteosarcoma, soft tissue sarcoma, medullablastoma, high-grade astrocytoma, retinoblastoma, Wilm's tumour, Ewing's sarcoma, bladder carcinoma, lung cancer, breast cancer, pancreatic cancer, osesophageal cancer, gastrointestinal cancer, sarcoma, head and neck tumours or melanoma. The present sequence is BAGE marker gene specific RT-PCR primer, used to illustrate the method of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                /note= "phosphorothioate backbone, nucleotides 1-5 and 16 -20 are 2'-methoxyethoxy (MOE) nucleotides, nucleotides 7
                                                                                                                                                                                                                                                                                                                                                                                           Measuring GD2 synthase mRNA, useful for detecting or diagnosing cancer, e.g. neuroblastoma, small cell lung cancer, melanoma, by performing realtime quantitative RT-PCR on the sample using appropriate primers of GD2
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Human, bifunctional apoptosis regulator, antisense, phosphorothioate,

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    The invention relates to a novel recombinant blood coagulation factor VIII, its production process and its medicinal composite for treating type-A haemophilia. The invention further comprises a medicinal composition containing the blood coagulation factor which promotes blood coagulation to the blood plasma of type-A haemophilia patients. This polynucleotide sequence represents an oligo relating to the recombinant blood coagulation factor VIII protein of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   New recombinant blood coagulation factor VIII and its production process and medicinal composition.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Beta 1, 4-N-acetylgalactosaminyltransferase; GD2 synthase; GM2; RT-PCR; reverse transcriptase PCR; medullablastoma; astrocytoma; retinoblastoma;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  쉱
                                                                                                                                                                                                                                                                                                    This invention describes a novel compound, 17-50 nucleobases in length which specifically hybridises with a nucleic acid encoding human which specifically hybridises with a nucleic acid encoding human but apoptosis regulator (BAR) and inhibits the expression of human BAR. The products of the invention have cytostatic and antiinflammatory activity and can be used to inhibit human BAR expression of during antisense therapy, useful for inhibiting the expression of human BAR in calls or tissues and for tracting diseases associated with expression of BAR in an animal, particularly a human suspected of having companies or condition associated with expression of chuman BAR. In addition the antisense oligonacleotides are useful for diagnostics, therapeutics and as research reagent, e.g. prophylactically to prevent or delay infection, inflammation or tumor formation. The coligonucleotides described in the invention human BAR antisense or coligonacce expressents a human BAR antisense oligonucleotide described in the disclosure of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  ;

The invention relates to a novel pharmaceutical composition, which has a first active agent comprising an oligonucleotide antisense to the intialiation coodon, coding region, 5' or 3' end genomic flanking regions, 5' and 3' intron-exon junctions, or regions within 2-10 nucleotides of installation codon, coding region, 5' or regions within 2-10 nucleotides of class all airway dysfunctions and a second active agent comprising an antiinflammatory steroid and ubjournone. A composition of the invention has antiinflammatory actorid and ubjournone. A composition of the invention has antiinflammatory antiallargic antiasthmatic, hypotensive, commonspressive, and cytostatic activity. The composition may have a use in antisense gene therapy. The composition is useful for treating or preventing a respiratory lung or malignant disease or condition, also for enhancing the prophylactic or therapeutic respiratory effect of an antiinflammatory steroid in a subject, for reducing levels of adenosine of or reducing sensitivity to adenosine, reducing levels of ubjouinne or lung surfactant in a subject, to treating bronchoconstriction, lung surfactant in a subject stissue, or treating bronchoconstriction, lung inflammation, lung allergies, or a respiratory disease or condition.

Note: The sequence data for this patent is not represented in the printed specification, but was obtained in electronic format directly from WIPO at the printed specification, but was obtained in electronic format directly from WIPO
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     ö

```

```
The invention relates to a novel pharmaceutical composition, which has a first active agent comprising an oligomucleotide antisense to the initiation codon, coding region, 5' or 3' or and genomic flanking regions; 5' and 3' intron-exon junctions, or regions within 2-10 mucleotides of junctions of genes encoding a polypeptide associated with lung and/or nasal airway dysfunction and a second active agent comprising an antiinflammatory steroid and ubsquinone. A composition of the invention has antiinflammatory, antiallargic, antiasthmatic, hypotensive, immunosuppressive, and cytostatic activity. The composition may have a use in antisense gene therapy. The composition is useful for treating or preventing a respiratory, lung or malignant disease or condition, also preventing a respiratory, lung or therapeutic respiratory effect of an antiinflammatory steroid in a subject, for reducing or depleting levels of, or reducing sensitivity to adenosine, receptor, producing bronchodilation, increasing levels of adenosine receptor, producing bronchodilation, increasing levels of adenosine receptor, producing bronchodilation, increasing bronchoconstriction, lung surfactant in a subject's tissue, or treating bronchoconstriction, lung shiflammation, lung alleragies, or a respiratory disease or condition. Note: The sequence data for this patent is not represented in the printed specification, but was obtained in electronic format directly from WIPO
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Sequence 20 BP; 2 A; 9 C; 5 G; 4 T; 0 U; 0 Other;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            at ftp.wipo.int/pub/published_pct_sequences

The invention relates to a novel pharmaceutical composition, which has a first active agent comprising an oligonuclectide antisense to the intiation coden, coding region, 5 or 3 end genemic flanking regions, 5 or 3 end genemic flanking regions, 5 or 3 end genemic flanking regions, 5 or regions within 2-10 muclectides of junctions of genes encoding a polypeptide associated with lung and/or nasal airway dysfunction and a second active agent comprising an antiinflammatory steroid and ubiquinone. A composition of the invention has antiinflammatory, antiallergic, antiasthmatic, hypotensive, communosuppressive, and cytostatic activity. The composition may have use in antisense gene therapy. The composition is useful for treating or preventing a respiratory, lung or malignant disease or condition, also for enhancing the prophylactic or therapeutic respiratory effect of an antiinflammatory steroid in a subject, for reducing or depleting levels of adenosine receptor, producing bronchodilation, increasing levels of adenosine receptor, producing bronchodilation, increasing bronchoconstriction, lung surfactant in a subject's tissue, or treating bronchoconstriction, lung sinflammation, lung allowers or a respiratory disease or condition not be printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published\_pct\_sequences

The invention relates to a novel pharmaceutical composition, which has a first active agent comprising an oligonuclectide antisense to the initiation codon, coding region, 5' or 3' end genomic flanking regions; 5' and 3' intron-exon junctions, 5' or regions within 2-10 nuclectides of 5' and 3' intron-exon junctions, or regions within 2-10 nuclectides of incrincians of genes encoding a polypeptide associated with lung and/or nasal airway dysfunction and a second active dwith lung and/or antiinflammatory steroid and ubiquinone. A composition of the invention than antiinflammatory antiallergic, antiaethmatic, hypotensive, immunosuppressive, and cytostatic activity. The composition may have a use in antiinflammatory, antiallergic, antiaethmatic, phypotensive, or reducing sensitivity to malignant disease or condition, also preventing a respiratory, lung or malignant crapitatory effect of an antiinflammatory steroid in a subject, for reducing or depleting levels of or enhancing bronchodilation, increasing levels of adenosine receptor, producing bronchodilation, increasing bronchoconstriction, lung surfactant in a subject's tissue, or treating bronchoconstriction, lung surfactant in a subject's tissue, or treating bronchoconstriction, lung sinflammation, lung altergies, or a respiratory disease or condition. Note: The sequence data for this patent is not represented in the printed specification, but was obtained in electronic format directly from WIPO
                                                                                                                                                                                                                                                            Pharmaceutical composition for treating ailments associated with impaired
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Human, antisense, lung dysfunction, nasal airway dysfunction, antinflammatory steroid, ubiquinone, antinflammatory, antiallergic, antiasthmatic; hypotensive, immunosuppressive, cytosteatic, gene therapy, antisense gene therapy, respiratory, lung, adenosine sensitivity, adenosine receptor, bronchodilation, bronchoconstriction, lung allergy, lung inflammation, respiratory disease; ds.
                                                                                                                                                                                                                                                                                 respiration, has oligo(s) antisense to specific gene(s) or its corresponding RNAs, and glucocorticoid or non-glucocorticoid steroid
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Gaps

Pharmaceutical composition for treating ailments associated with impaired respiration, has oligo(s) antisense to specific gene(s) or its corresponding RNAs, and glucocorticoid or non-glucocorticoid steroid or

Disclosure; SEQ ID NO 3318; 872pp; English.

first active agent comprising an oligonucleotide antisense to the intration codon, coding region, 5' or 3' end genomic flanking regions, initiation codon, coding region, 5' or 3' end genomic flanking regions, intran-exon junctions, or regions within 2-10 nucleotides of junctions of genes encoding a polypeptide associated with lung and/or nasal airway dysfunction and a second active agent comprising an antiinflammatory steroid and ubiquinone. A composition of the invention has antiinflammatory, antiallergic, antiathmatic, hypotensive, immunosuppressive, and cytostatic activity. The composition may have a use in antisense gene therapy. The composition is useful for treating or preventing a respiratory, lung or malignant disease or condition, also for enhancing the prophylactic or therapeutic respiratory effect of an antiinflammatory steroid in a subject, for reducing levels of adenosine receptor, producing bronchodilation, increasing levels of ubiquinone or lung surfactant in a subject, for treating bronchocanstriction, lung inflammation, lung allergies, or a respiratory disease or condition. Note: The sequence data for this patent is not represented in the printed or fer this printed or fear in the printed or fear in the form with form with form and contains the form of the form or the form of at ftp.wipo.int/pub/published\_pct\_sequences

(BPIG-) EPIGENESIS PHARM INC

Pabalan J, Aguilar D; Katz E, Li Y, Sandrasagra A, K Tang L, Shahabuddin S; Nyce JW, I Miller S,

WPI; 2003-229219/22.

Pharmaceutical composition for treating ailments associated with impaired respiration, has oligo(s) antisense to specific gene(s) or its corresponding RNAs, and glucocorticoid or non-glucocorticoid steroid or ubiquinone

Disclosure; SEQ ID NO 3504; 872pp; English.

The invention relates to a novel pharmaceutical composition, which has a first active agent comprising an oligomucleotide antisense to the initiation codon, coding region, 5' or 3' end genomic flanking regions, 5' or 3' end genomic flanking regions, 5' and 3' intron-exon junctions, or regions within 2-10 mucleotides of junctions of genes encoding a polypeptide associated with lung and/or nasal airway dysfunction and a second active agent comprising an antiinflammatory steroid and ubiquinone. A composition of the invention has antiinflammatory, antiallergic, antiasthmatic, hypotensive, and cytostatic activity. The composition may have a use in antisense gene therapy. The composition is useful for treating or preventing a respiratory, lung or mallignant disease or condition, also for enhancing the prophylactic or therapeutic respiratory effect of an antiinflammatory steroid in a subject, for reducing or depleting levels of of an antiinflammation, lung antiense, reducing levels of adenosine receptor, producing bronchodilation, increasing levels of adenosine receptor, producing bronchodilation, increasing levels of ubiquinone or lung surfactant in a subject's tissue, or treating bronchoconstriction, lung alfalmmation, lung alergies, or a respiratory disease or condition. Note: The sequence data for this patent is not represented in the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published\_pct\_sequences

The invention relates to a novel pharmaceutical composition, which has a first active agent comprising an oligonuclectide antisense to the introduced coding coding region, 5' or 3' end genomic flanking regions, 5' and 3' intron-exon junctions, or regions within 2-10 muclectides of junctions of genes encoding a polypeptide associated with lung and/or nasal airway dysfunction and a second active agent comprising an antihilammatory steroid and ubiquinone, A composition of the invention has mutinflammatory, antialergic, antiasthmatic, hypotensive, immunosuppressive, and cytostatic activity. The composition may have a use in antisense gene therapy. The composition is useful for treating or preventing a respiratory, lung or malignant disease or condition, also antihilammatory steroid in a subject, for reducing levels of an antihilammatory steroid in a subject, for reducing levels of adenosine receptor, producing bronchodilation, increasing levels of adenosine receptor, producing bronchodilation, increasing levels of ubiquinone or lung surfactant in a subject sitesue, or treating bronchoconstriction, lung airlammation, lung allergies, or a respiratory disease or condition. Note: The sequence data for this patent is not represented in the printed specification, but was obtained in electronic format directly from WIPO.
                                                                                                                                                                                                                                                                                   Pharmaceutical composition for treating ailments associated with impaired respiration, has oligo(s) antisense to specific gene(s) or its corresponding RNAs, and glucocorticoid or non-glucocorticoid steroid or

Pharmaceutical composition for treating ailments associated with impaired respiration, has oligo(s) antisense to specific gene(s) or its corresponding RNAs, and glucocorticoid or non-glucocorticoid steroid or ubiquinone.

Claim 15; SEQ ID NO 843; 872pp; English.

The invention relates to a novel pharmaceutical composition, which has a first active agent comprising an oligonuclectide antisense to the initiation codon, coding region, 5' or 3' end genomic flanking regions, 5' and 3' intron-exon junctions, or regions within 2-10 nucleotides of junctions of genes encoding a polypeptide associated with lung and/or nasal airway dysfunction and a second active agent comprising an antiinflammatory teroid and ubiquinone. A composition of the invention has antiinflammatory, antiallergic, antiasthematic, hypotensis or the invention has antiinflammatory, antiallergic, antiasthematic, hypotensis or composition may have a use in antisense gene therapy. The composition is useful for treating or preventing a respiratory, lung or malignant disease or condition, also for enhancing the prophylactic or therapeutic respiratory effect of an antiinflammatory steroid in a subject, for reducing or depleting levels of antiinflammation, ing also the prophylactic or therapeutic respiratory effect of an antiinflammatory steroid in a subject, for reducing levels of adenosarine receptor, producing bronchodilation, increasing levels of adenosarine receptor, producing bronchodilation, increasing levels of adenosarine receptor, producing bronchodilation, increasing levels of adenosarine receptor, broducing bronchodilation, increasing levels of adenosarine receptor, but was obtained in electronic format directly from WIPO and format directly from WIPO ftp.wipo.int/pub/published\_pct\_sequences

Pharmaceutical composition for treating ailments associated with impaired respiration, has oligo(s) antisense to specific gene(s) or its corresponding RNAs, and glucocorticoid or non-glucocorticoid steroid or WPI; 2003-229219/22.

Claim 15; SEQ ID NO 1677; 872pp; English

The invention relates to a novel pharmaceutical composition, which has a first active agent comprising an oligonucleotide antisense to the intitation codon, coding region, 5 or 3 end genomic flanking regions, 5 and 3 intron-exon junctions, or regions within 2-10 nucleotides of Junctions of genes encoding a polypeptide associated with lung and/or nasal airway dysfunction and a second active agent comprising an antiinflammatory steroid and ubjections. A composition of the invention has antiinflammatory, antiallergic, for reducing or depleting levels of adenosine receptor, producing bronchodilation, increasing levels of adenosine receptor, producing bronchodilation, increasing bronchoconstriction, lung surfactant in a subject's tissue, or treating bronchoconstriction, lung inflammation, lung allergies, or a respiratory disease or condition.

```
The invention relates to preventing desulphurization of an oligomuclectide or its bioequivalent comprising one or more phosphorothioate linkages in a bi-phasic or multi-phasic formulation. The method involves including in the formulation an antioxidant which partitions into the aqueous phase of the formulation. The method is useful for increasing the stability of oligomucleotide comprising phosphorothioate linkages. The present sequence represents a 2 decoypoligomucleotide having a phosphorothioate backbone and is targeted to the 3 UTR (untranslated region) of ICAM-1 (intercellular adhesion
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Hormone-sensitive lipase, antisense oligonucleotide, inhibitor; obesity, phosphorochioace, antidiabetic; anorectic; cytostatic; antisense therapy, abnormal metabolic condition; hyperpripidaemia; type 2 diabetes; cancer; hyperproliferative disorder; human; ss.

The present invention describes a compound (I) 8-50 nucleobases in length targeted to a nucleic acid molecule encoding a hormone-sensitive lipase (HSL) or a splice variant of HSL. The compound specifically hybridises with and inhibits the expression of HSL or a splice variant of HSL, or specifically hybridises with at least an 8-nucleobase portion of an active site on a nucleic acid molecule encoding HSL. (I) have anorectic, antidiabetic and cytostatic acidityties, and can be used in antisense therapy. (I) is useful for treating an animal, particularly human, hyperlipidaemia, type 2 diabetes, a hyperproliferative disorder such as cancer (e.g. picuitary, colorectal, breast, testicular, pulmonary or epithelial cancer). (I) is also useful in modulating blood glucose levels, particularly plasma or serum glucose levels, in a diabetic animal. The present sequence represents a human hormone-sensitive lipase chimeric phosphorothicate antisense oligonucleotide, which is used in an example from the present invention
                                                                                                                                               New antisense oligonucleotides targeted against nucleic acids encoding hormone-sensitive lipase, useful for treating abnormal metabolic condition, e.g. hyperlipidemia and obesity, or a hyperproliferative disorder, e.g. cancer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   enhanced gastrointestinal absorption; ulcerative colitis; rheumatoid archritis, Crohn's disease; inflammatory bowel disease; abnormal cellular proliferation; ss.

Pulsed release oral formulation providing enhanced gastrointestinal absorption, comprises first particles containing drug and penetration enhancer and second particles containing delayed release penetration

Disclosure; Page 28; 59pp; English.

The present invention describes a delayed release oral formulation (A), giving enhanced gastrointestinal (GI) absorption of a drug (I). (A) comparises a first set of particles containing (I) and a penetration enhancer (II) and a second set of particles containing (II) in a delayed release coating or matrix (III). (A) is used for enhancing the absorption of [II] in mammala, especially humans. Typical disorders to be treated include ulcerative colitis, rheumatoid arthritis, Crohn's disease inflammatory bowel disease and abnormal cellular proliferation. When the particles release (I) and (II) at a first location in the GI tract (generally the intestines), (II) is rapidly absorbed (during a first release pulse) and is often present in insufficient amount to promote absorption of the entire dose of (I). This problem is solved by providing further (II) in delayed release form in the particles, so that absorption of (I) is completed in a second pulse. The present sequence represents an exemplary oligonucleotide from the present invention which inhibits ICAM-

The invention relates to a novel compound that is 8-50 nucleotides in length that is targeted to a nucleic acid molecule encoding apported in a nucleic acid molecule encoding and inhibits the expression of a nucleic acid molecule encoding ApoB; or which specifically hybridises with at least an 8-nucleotide portion of an active site on a nucleic acid molecule encoding ApoB; or which specifically hybridises with at least an 8-nucleotide portion of an activity action and activity and santilipsemic, antitateriosclerotic, antidiabetic, and cardiovascular activity. The compound may have a use in animal having a disease or conditions associated with ApoB, e.g. a condition involving abnormal lipid metabolism, a condition involving an abnormal lipid metabolism, a condition involving an abnormal metabolic condition (e.g. hyperlipidaemia, diabetes (specifically Type 2 diabetes), obseity, atherosclerosis or activity an abnormal metabolic condition of e.g. hyperlipidaemia, diabetes (specifically Type 2 diabetes), obseity, atherosclerosis or cardiovascular disease). The new compound or the antisense oligonucleotide is also useful for modulating glucose levels (specifically VaDL, MDL or LDL) or serum triglyceride levels canimal, or for modulating serum cholesterol levels, lipoprotein levels (specifically VaDL, MDL or LDL) or serum triglyceride levels, particularly in a human. The antisense compound is also useful for serum trighyceride levels, human the onset of a disease or condition associated with ApoBs, or the onset of a disease or condition the animal or human. The present sequence is used in the exemplification of the

ö New antisense chimeric oligonucleotide, useful for modulating the expression of human Interleukin 12 p40 subunit, in treating or preventing disease states in humans and animals, and as research reagents and length targeted to a start codon region, coding region, a stop codon region or a 3'-untranslated region of a nucleic acid molecule encoding human Interleukin 12 p40 subunit. The compound specifically hybridises with one of the regions and inhibits the expression of human Interleukin 12 p40 subunit. The new compound is useful for inhibiting the expression of human Interleukin 12 p40 subunit in cells or tissues and comprises contacting the cells or tissues in vitro with the compound, so that antisense compound may also be used as research reagents and diagnostics, and as treatment or prevention of disease states, e.g. to prevent or delay infection, inflammation or tumour formation, in animals and humans. The present sequence is an antisense oligonucleotide of the invention Gaps The invention relates to an antisense compound 20-50 nucleobases in ö Score 13.6; DB 1; Length 20; Pred. toxicological response to an agent, which comprises comparing the expression profile of one or more human toxic response genes to a reference gene expression profile indicative of toxicity, and so determining the presence of a toxic response to the agent. Also described: (1) an array comprising one or more polynucleotides selected from the genes corresponding to the partial sequences given in ABS2842 to ABS84764, or their fragments of at least 20 nucleotides, or homologues; and (2) determining if a gene putatively identified to be a toxic response gene playes a role on toxic response pathways by determining the expression profile of the gene after exposure of cells or a human subject to a known toxic pharmaceutical or industrial agent, comprising: (a) exposing cells to an agent or isolating cells from a human subject to a known toxic pharmaceutical or industrial agent, comparing the test or a putatively identified toxic response gene after exposure to a known toxic pharmaceutical or industrial agent; and (c) comparing the test profile to the expression profile of a gene with a similar function or comparing the test profile to the expression profile of a gene with a similar function or comparing the test profile to other known toxic compounds. The methods are useful for predicting and determining toxicological responses on a cellular, organ or system level. The arrays compirating the human genes are useful for toxicological screening of drugs, pharmaceutical compounds and chemicals

Identifying regions of neoplastic growth in a human body, useful for detecting or predicting metastasis, comprises administering to the human body an antibody or peptide that specifically binds to a protein marker of neoplastic growth.

Example 2; Page 22; 42pp; English

The invention relates to methods for identifying regions of neoplastic growth in a human patient, especially for detecting or predicting carewith in a human patient, especially for detecting or predicting carewith in a human patient, especially for detecting or predicting carewith in a werexpressed, either by the use of an antibody specific for the protein, or by the use of FCR or hybridisation to detect nucleic acids encoding the marker proteins. A set of neoplastic growth markers are disclosed (SAGE (serial analysis of gene expression) tags for these are given in ADA26759-ADA26796), with protein tyrosine phosphatase type IVA member 3 (also known as FRL-3) being a preferred neoplastic growth markers are specifically expressed at a higher level in metastatic cancers, compared with advanced and early growth markers are specifically expressed at a higher level in metastatic cancers. The invention also oversypression of the neoplastic growth markers is taken as an indication that the tissue has a propensity to metastaise. The invention also cancer, and for identifying candidate drugs for treating advanced or metastatic cancers. The methods of the invention are useful for identifying candidate drugs for treating advanced or metastasis, or identifying candidate drugs for treating advanced or metastasis, or identifying candidate drugs for treating advanced or metastasis, or identifying candidate drugs for treating advanced or metastasis, or identifying candidate drugs for treating advanced or metastasis, or identifying candidate drugs for treating advanced or metastasis cancers. The invention is particularly applicable to metastasis or identifying and for targeting cytocial cancers. Antibodies which bind to the neoplastic growth marker proteins are additionally useful for diagnostic imaging and for targeting orthogones are experse to human PRL-3 gene (located at chromosome 8q24.3) in an example of the invention of the present sequence represents a reverse invention. 8KGGGGGGGGGGGGGGGGGGGGGGGGGGGGGGG

```
The invention relates to an oligonucleotide 8-50 nucleotides in length which is targeted to mRNA encoding human c-raf, a-raf or b-raf (raf is a protein kinase playing a regulatory role in signal transduction, regulating cell proliferation and has been implicated in lung carcinoma, and which is capable of inhibiting raf expression. Also included is a composition comprising the oligonucleotide and a pharmaceutically acceptable carrier. The antisense oligonucleotide is useful for inhibiting the expression of human raf in human cells or tissues, by contacting the human cells or tissues with the oligo. The oligo. is also is useful for treating or preventing a disease or condition with a chemotherapeutic agent to a human or cells of the human, where the expression of raf by administering it in condition with a chemotherapeutic agent to a human or cells of the human, where the expression of raf by administering and the condition is a neovascularisation (preferably coular angiogenesis or neovascularisation). The oligo, is also useful for inhibiting checking and determining the role of raf expression in various cell functions and abhalological processes and conditions and physiological processes.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  present sequence is an antisense oligonucleotide targeting

comprises detecting Determining an individual's risk for type 1 diabetes, comprises detecting the presence of an insulin dependent diabetes mellitus-associated interleukin 4 receptor allele in a nucleic acid sample of the individual.

Example 4; Page 35; 79pp; English.

The sequences given in ABQ80141-52 represent primers which were used to identify wild type and variant loci in the human interleukin 4 receptor CC (ILAR). These primer sequences were used in the method of the invention of determining an individual's risk for type 1 diabetes. The method comprises detecting the presence of an insulin dependent diabetes comprises detecting the presence of an insulin dependent diabetes comprises (IDDM)-associated interleukin 4 receptor allele in a mucleic acid sample of the individual, where the presence of the allele indicates the individual, where the presence of the allele indicates the individual. Sink for type 1 diabetes. The method identifies one or compressing an individual's risk for any autoimmune disease or condition or individual's risk for any autoimmune disease or condition or any T helper type 1 mediated disease, systemic luptue clerosis, minflammatory bowel disease, systemic luptue correctly providual's risk for any autoimmune disease, systemic correctly myssthemia gravis, gcleroderma, Grave's disease, systemic chyptoiditis

```
The present invention describes an oral pharmaceutical formulation (I) for delivering a bioreactive macromolecule to a mucosal surface. (I) comprises a first population of carrier particles comprising drug and a bioadhesive compound; and a second population of carrier particles comprising a penetration enhancer. Also described is a method for enhancing the mucosal absorption of the bioactive macromolecule in a mammal (preferably a human) by mucosally administering (I). (I) has antiulcer, antiliflammatory, antirheumatic, antiarthritic and cytostatic activities. (I) can be used for delivering a bioreactive macromolecule to a mucosal surface. It is used for the oral delivery of a drug to an animal encompassing a human as well as other mammals, reptiles, fish, amphibians and birds. It is used to deliver drugs including peptides, proteins, monoclonal antibodies their fragments, nucleic acids (DNA) and RNA), oligonucleotides, antisense oligonucleotides, and small molecules. It can be used to examine the function of various proteins and genes in an animal, including those that are sessential to animal development. It can be used for the treatment of animals that are known or suspected to suffer from any disease treatable with the inventive composition, e.g. ulcerative collits, rheumatod arthitis, crobir s disease, or undue cellular proliferation (cancers and tumours). The present sequence represents an exemplary oligonucleotide from the present invention, which can be used to inhibit ICAM-1
                                                                                    Oral pharmaceutical formulation for delivering bioreactive macromolecule to mucosal surface, contains drug, bioadhesive compound, and penetration
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             primer; Vpr; ss; immune response; immunocompromise; HIV; cancer; therapy.

The invention relates to a DNA or RNA construct capable of expressing interleukin (IL)-2 in a warm-blooded animal or biological preparation, comprising a Vpr activated promoter, a transcribable DNA segment coding for a signal peptide functional in mammary cells and secretory DNA encoding for a signal peptide functional in segment to facilitate secretion of IL-2. The construct is useful for increasing the immune response of a warm-blooded animal or biological preparation, by introducing the construct in stem cells, antigen or presenting cells or immune cell leukocytes, fibroblasts and epithelial cells, of the warm-blooded animal or biological preparation. The warm-blooded animal is an immal or biological preparation. The warm-blooded animal is an immunocompromised patient. The method is useful for stimulating immune response in immunocompromised patients affected with HIV, cancer and other immunocompromised patients. The present sequence represents a Vpressing applayed in the sequence listing but no further reference is made to it
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           ö
                                                                                       Novel DNA or RNA construct for increasing immune response of warm-blooded animal, has Vpr activated promoter, DNA segment encoding interleukin 2 and secretory DNA encoding signal peptide functional in mammary cells.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       ņ
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Antisense oligonucleotide, cytostatic; immunosuppressive; antiinflammatory; gene therapy; hyperproliferative disorder; cancer; autoimmune; inflammatory disorder; inhibitor-kappa B kinase-gamma; ss;

The specification describes a method of analysing DNA or RNA targets. The method comprises contacting the targets with oligonucleotide probes attached to an enzyme cofactor marker which is recognized less by the enzyme when it is on a free oligonucleotide than when it is on a hybridized oligonucleotide. The method is useful for analysing DNA or RNA targets. The invention is used to determine the amount of a target nucleic acid in a biological sample and the level of complementarity between the probe and the target nucleic acid. The present sequence represents an oligonucleotide probe attached to flavin. an enzyme cofactor marker for flavin reductase. The probe, together with its complement ABZ77540, was used to study the activity of flavin reductase
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Substrates having number of ligands immobilized on predetermined regions of its surface, applicable in gene engineering for studying relationship between structures and biological activity of endocrine disrupters.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   substrate; ligand; signal; ligand binding; immobilisation;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     a
                                                                                                                                                                                                                                                                                                                                                                                                                          The invention relates to an antisense compound that is targeted to a nucleic acid encoding inhibitor-kappa B kinase-gamma, specifically hybridising to the nucleic acid encoding inhibitor-kappa B kinase-gamma and inhibiting its expression. Compounds of the invention are antisense cligonucleotides comprising at least one modified internucleoside invention are antisense cligonucleotides compromined in kappa on the invention are antisense modety, which is a 2-0-methoxyethyl sugar modety, or at least one modified nucleobase, which is a 5-methylcytosine. Preferably, the modified nucleobase, which is a 5-methylcytosine. Preferably, the invention is useful for preparing a composition for treating a hyperproliferative disorder e.g., cancer, or an autoimmune or hyperproliferative disorder e.g., cancer, or an autoimmune or infinibitor-kappa B kinase-gamma in cells or tissues, and treating an animal having a disease or condition associated with thibitor-kappa B kinase-gamma. Sequences given in ADA44713-ADA44790 represent antisense oligonucleotides for the inhibition of human mRNA levels.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                ö
                                                                                                                                                                                                                                                                                           New compound having sequence targeted to nucleic acid encoding inhibitor-kappa B kinase-gamma, useful for preparing composition for treating e.g., cancer, or inflammatory or autoimmune disorder.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Probe; enzyme cofactor marker; enzyme; flavin; flavin reductase; ss.

The present invention describes a substrate having a number of ligands which have been immobilised onto a predetermined region of its surface, in which the region on the substrate has such a shape as to allow the concentration of signals caused by binding of the ligands to receptors in the region toward the receiver. Also described is a substrate for the immobilisation of such ligands. The substrates are applicable in generaginering for studying relationship between structures and biological activity e.g. effect of endocrine disrupters on various genes and also in investigating the effect of hormones, drugs and other chemicals on the environment. Such substrates are highly sensitive in detecting the ligand-receptor binding, with affinity and reproducibility. The ligandimobilised substrates can be produced in high density e.g. in microarray form to provide finely tuned results. ADA00221 to ADA00282 represent PCR primers used for amplifying genes in the exemplification of the present Sequence 20 BP; 5 A; 5 C; 3 G; 7 T; 0 U; 0 Other; Example 1; Page 33; 52pp; Japanese. invention

Agrawal S, Kandimalla ER;

New synthetic oligonucleotide complementary to nucleic acids encoding epidermal growth factor receptor (BGFR), useful for inhibiting the BGFR gene or mRNA expression, and reducing cancer cell proliferation. WPI; 2003-120540/11.

Claim 10; Page 12; 36pp; English.

complementary to a region of nucleic acid encoding epidermal growth factor receptor (EGFR) with location 245-1117, 2407-3201, 3786-4102 or 4574-45633. The methods and compositions of the invention are useful for annancing inhibition of EGFR gene or mRNA expression, and reducing cancer cell proliferation, in particular cancer cells of the colon, ovarian or breast. Sequences ABZ23811-832 represent specific examples of such The invention relates to synthetic antisense oligonucleotides

New antisense compound, useful for preparing a composition for diagnosing, treating or preventing inflammatory diseases, e.g. rheumatoid arthritis.

Example 5; Col 27-28; 44pp; English.

This invention describes a novel antisense compound, which is 8-30 mucleobases in length targeted to a nucleic acid molecule encoding p38 mitogen-activated protein kinase (MAPK). He products of the invention have antiarthitic and antiinflammatory activity, can act as act as kinase inhibitors. The antisense compound is useful for preparing a composition for diagnosing, treating or preventing inflammatory diseases, e.g. rheumatoid arthritis or for use in antisense gene therapy. This sequence represents an antisense oligonucleotide used in a method to inhibit p38 MAPK

The antisense oligonucleotides were designed to target different regions of the human p70 S6 kinase RNA, and were analysed for their effect on mRNA proved by quantitative real-time PCR. p70 S6 kinase (also known as SK6, p70/p85 s6 kinase, p70/p85 ribosomal S6 kinase and pp70s6k) is a serine-threonine kinase responsible for the phosphorylation of the ribosomal S6
                                                                                                                                                                                                                                                                                                                                                              /note= "Phosphorothioate linkages. When bases 1-5 and 16-20 are not 2'-methoxyethyl (2'-MOB) nucleotides, all cytosines in the oligonucleotide are 5-methylcytosine"
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Novel antisense compound which is targeted to nucleic acid encoding p70 S6 kinase, and inhibits expression of p70 S6 kinase, useful for treating a condition associated with p70 S6 kinase, e.g. cancer.
                                                                                                                                                                                                                                                                                                                                                                                                                                /note= "Optionally 2'-methoxyethyl (2'-MOE) nucleotides.

protein, which in turn stimulates protein synthesis. p70 S6 kinase function is essential for cell cycle progression, and has also been implicated in the regulation of the immune response. p70 S6 kinase is itself activated via phosphorylation, a process influenced by upstream signalling cascades and by hyperinsulinaemia, and may play a role in the progression of colon cancer and in the development of lipotoxic disorders and obesity. The oligonoucleoides of the invention are useful for the prevention and treatment of conditions associated with p70 S6 kinase, such as hyperproliferative disorders such as cancer, and metabolic disorders. They are also useful in research and diagnostics for modulating the expression of p70 S6 kinase
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      The invention comprises DNA sequences that show enhanced expression in human neuroblastoms with good prognosis. The DNA sequences of the invention are useful in clarifying good/poor prognosis of neuroblastoms. The present DNA sequence was used in the exemplification of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Nucleic acids isolated from neuroblastoma showing enhanced expression in human neuroblastoma with good prognosis, useful in clarifying good/poor prognosis of neuroblastoma and providing genetic data.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Gaps

The sequences given in ABO80256-69 are primers which were used to identify the presence of vascular endothelial growth factor (VBGP), or the VBGF receptors, FIK1, FIT-1 and FIT-4 in human stem cells (BSC). The method of the invention for alleviating or reducing a symptom of a disease or disorder of the nervous system comprises administering prowth factor (VBGP), a combination of PDGF and VBGF, or a PDGF or VBGF agonist, to a post or modulate neural stem cell or neural progenitor cell activity in vivo. The method is useful for alleviating or reducing the symptoms of a disease or disorders of the nervous system, e.g. neurodegenerative disorders, neural stem cell disorders, neural progenitor disorders, ischemenic disorders or learning or reducing the symptoms of a disease and disorders or learning and memory disorders, neuropsychiatric disorders or learning and memory disorders, neuropsychiatric disorders or learning and memory disorders, spinal sord injury or cancer-related brain/ spinal cord injury or cancer-related brain spinal cord injury or cancer-related brain spinal cord injury or cancer symptomes, se

The invention relates to antisense oligonucleotides (ACF33752-ACF33779)
targeted to the human CREB (cAMP response element binding protein) gene,
which inhibit its expression. The oligonucleotides were designed to
target different regions of human CREB mRNA, and were analysed for their
effect on CREB expression by quantitative real-time PCR. CREB (also known
as CREB1) is a member of the basic leucine zipper (bZIP) family of
transcription factors, and activates transcription of target genes in
response to a diverse array of stimuli including peptide hormones, growth
actors and protein kinases. It is a component of intracellular
captors and protein kinases. It is a component of intracellular
signalling spermatogenesis, circadian rhythms and memory. Overexpression
of CREB has been found to induce apoptosis in certain cells, although
CREB overexpression may also be linked to cancer as it is constitutively
activated in human somatotroph adenomas. CREB may also play a role in the
development of drug dependency, as it has been found to mediate morphine-
induced upregulation of the CAMP pathways that contribute to opiate
dependency. The oligonucleotides of the invention are useful for
diagnosis, prevention and treatment of CREB-related disorders, such as
hyperproliferative disorders (particularly cancer, e.g., those of blood
and soft tissue), diseases or conditions arising from aberrant apoptosis,
or neuronal disorders. The present sequence represents a human H-ras
phosphorchioate antisense oligonucleotide used as a positive control in
iterative determining optimal oligonucleotide concentration for a particular cell
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Nucleic acids having higher expression in human neuroblastoma with poor prognosis for diagnostic prediction of neuroblastoma prognosis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            The invention comprises nucleic acids that show increased expression in
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Neuroblastoma; prognosis; spontaneous regression; primer; probe; ds; high malignancy.

human neuroblastomas with poor prognosis over those with a good prognosis. The nucleic acids of the invention are useful as a tool for distinguishing neuroblastomas with a favourable prognosis (spontaneous regression) from neuroblastomas with a poor prognosis (high malignancy) The DNA sequences ABT32224 - ABT32571 represent oligonucleotides used i

Example 15; Page 85; 139pp; English. 

The present invention describes a compound (1) 8-50 nucleobases in length targeted to a nucleic acid molecule encoding BCL2-associated X (BAX) protein, where the compound specifically hybridises with the mucleic acid molecule encoding BAX protein. The compound specifically hybridises with at least 8-nucleobase portion of an active site on a nucleic acid molecule encoding BAX protein. Also described: (1) a composition comprising (7) and a pharmaceutical carrier or diluent; (2) inhibiting the expression of BAX protein in cells or tissues comprising contacting the cells or tissues with (1); and (3) treating an animal having a disease or condition associated with BAX protein comprising contacting to the animal (1) so that expression of BAX protein is inhibited. (1) has nootropic, neuroprotective, antiparxinsonian, anticonvulsant, ophichalmological, antidiabetic and virtibaxinsonian, anticonvulsant, ophichalmological, antidiabetic and virtical activities, and can be used in antisense therapy, and as a BAX antagonist. The antisense compounds (1) are useful for modulating the expression of BAX protein, and for treating a disease or condition associated with BAX protein, and for treating a disease or condition associated with BAX protein, e.g. familial amylotrophic lateral schedular hyperplasia, diabetes-associated ocular disorders or screnis infection, or a condition that arises from aberrant apoptosis. The present sequence represents a human BAX chimeric phosphorothhoate present invention.

New antisense compounds, useful for modulating the expression of BCL2-associated X (BAX) protein or for treating a disease or condition associated with BAX protein, e.g. Parkinson's disease, Hodgkin's disease or Alzheimer's disease

Example 17; Page 94; 139pp; English

The present invention describes a compound (I) 8-50 nucleobases in length targeted to a nucleic acid molecule encoding BCI2-associated X (BAX) protein, where the compound specifically hybridises with the nucleoca acid molecule encoding BAX protein and inhibits the expression of BAX protein. The compound specifically hybridises with at least 8-nucleobase portion of an active site on a nucleic acid molecule encoding BAX protein. The composition comprising (I) and a pharmaceutical carrier or diluent; (2) inhibiting the expression of BAX protein in cells or tissues comprising contacting the cells or tissues with (I); and (3) treating an animal having a disease or condition associated with BAX protein is inhibited. (I) has nootropic, neuroprotective, antiparkinsonian, anticonvilsant, ophthalmological, antidiabetic and virtode activities, and can be used in antisense therapy, and as a BAX antiagonist, the antisense compounds (I) are useful for modulating the expression of BAX protein, and for treating a disease or condition associated with BAX protein, and for treating a disease or condition associated with BAX protein, e.g. familial amylotrophic lateral expression of BAX protein, e.g. familial amylotrophic lateral cartiage-hair hyperplasia, diabetes-associated coular disorders or scrapie infection, or a condition that arises from aberrant apoptosis. The present sequence represents a mouse BAX chimeric phosphorothioate present invention.

```
The present invention describes a compound (1) that is 8-50 nucleobases in length: (a) targets a nucleic acid molecule encoding major histocompatibility complex (MHC) class II transactivator, and inhibits the expression of MHC class II transactivator, and inhibits the expression of MHC class II transactivator. Complex (MHC) specifically hybridises with at least an 8-nucleobase portion of an active site on a nucleic acid molecule encoding MHC class II transactivator. (I) has immunosuppressive, antimicrobial, antidiabetic, antirheumatic, antiarthrities, and can be used as an MHC class II transactivator inhibitor. The MHC class II transactivator and immunostimilar activities, and can be used as an integense oligonuclectides can be used for treating an animal having a disease or condition associated with MHC class II transactivator, e.g. autoimmune disorder or infection. The antisense oligonuclectides can be used for inhibiting the expression of MHC class II transactivator in cells or tissues. In particular, these diseases include transplant celection, diabetes, heumatoid arthritis, cancer, Alzheimer's disease, multiple sclerosis, or severe combined immunodeficiency disease. The mitisense compounds are useful for diagnostics, prophylaxis, or as research reagents an example from the present invention converse.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    New antisense oligonucleotides for modulating MHC class II transactivator gene expression, particularly useful for treating autoimmune disorders such as transplant rejection, Alzheimer's disease, or multiple sclerosis,

```
The invention relates to antisense compounds targetted to the nucleic acid encoding the G protein-coupled receptor ETBR-LD-2 (endothellin type b racid encoding the G protein-2) to inhibit its expression. ETBR-LD-2 is also known as endothelin-binding receptor-like protein-2, ETBR-LIke protein 2 and G-protein coupled receptor 37 like 1 (6FB2ALI). Antisense compounds of the invention are useful for treating hyperproliferative disorders (especially cancer) and cardiovascular diseases especially angiogenesis, attrocederosis, hypertension, cerebral vascular disease, stroke and acute proliferative nephropathy. The present sequence is an antisense oligonucleotide targetted to human ETBR-LD-2 DNA
                                                                                                                 Human, G protein-coupled receptor; hyperproliferative disorder; GPR37L1; endothelin type b receptor-like protein-2; cerebral vascular disease; antisense; endothelin-binding receptor-like protein-2; atherosclerosis; cardiovascular disease; ETRR-LP-2; G-protein coupled receptor 37 like 1, acute proliferative nephropathy; ETBR-like protein 2; cancer; stroke;

The invention relates to antisense compounds targetted to the nucleic acid encoding the G protein-coupled receptor FTBR-LB-2 (endothelin type b receptor-like protein-2) to inhibit its expression. FTBR-LB-2 is also known as endothelin-binding receptor-like protein-2, ETBR-Like protein 2 and G-protein coupled receptor 37 like I (GRR3TLI). Antisense compounds of the invention are useful for treating hyperproliferative disorders (especially cancer) and cardiovascular diseases especially angiogenesis, attrocelerosis, hypertension, cerebral vascular disease, stroke and acute proliferative nephropathy. The present sequence is an antisense oligonucleotide targetted to human ETBR-LP-2 DNA
                                                                                                                                                                                                                                             Human, G protein-coupled receptor; hyperproliferative disorder; GPR37L1; endothelin type b receptor-like protein-2; cerebral vascular disease; antisense; endothelin-binding receptor-like protein-2; atherosclerosis; cardiovascular disease, ETBR-LP-2; G-protein coupled receptor 37 like 1; acute proliferative nephropathy; ETBR-like protein 2; cancer; stroke; anglogenesis; hypertension; phosphorothioate; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 /note= "Phosphorothioate backbone; All cytidine residues are 5-methylcytidines"
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         New oligonucleotides which bind the nucleic acid encoding the G protein coupled receptor ETBR-LP-2 (endothelin type b receptor-like protein-2 receptor), useful for treating e.g. cancer and cardiovascular diseases.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      /mod_base= OTHER

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            The invention describes a method of treating non-allergic inflammatory disease comprising administering to a subject having or at risk of developing a non-allergic inflammatory disease an immunostimulatory nucleic acid for prevention or treatment of the disease. The method is useful for treating non-allergic inflammatory diseases, such as psorianis, eczema, allergic context dermatitis, latex dermatitis or inflammatory bowel disease e.g., ulcerative colitis or Crohn's disease. This sequence represents an immunostimulatory nucleic acid

Novel isolated polynucleotide comprising a mouse or human familial combined hyperlipidemia 1 gene having a variation that is associated with a lipid disorder, useful for identifying susceptibility to the lipid

Claim 11; Page 40; 63pp; English.

The invention discloses isolated polymucleotides comprising mouse HYPLIPI CDNA sequence, mouse HYPLIPI genomic DNA, or the homologous human channed mouse HYPLIPI genomic DNA, or the homologous human considered mouse HYPLIPI genomic DNA, or the homologous human considered mouse HYPLIPI and the sequence is associated with a lipid disorder. Also claimed is an isolated polyperlipidation of fully defined human FCHL1 amino acid sequence, or a variant form of a fully defined human FCHL1 amino acid sequence, where the variant form of a fully defined human FCHL1 amino acid sequence, where the variant is associated with the lipid disorder. The variation position, an isolated polypeptide comprising 4 contiguous amino acids of the encode polypeptides, where the 4 contiguous amino acids of the encode polypeptides, where the 4 contiguous amino acids of the variation position, a kit for the detection of the FCHL1 locates span the variation position, a kit for the detection of the FCHL1 cloud sequence of the difference between the suspected allele and the wild-type sequence the difference between the suspected allele and a transagenic animal which carries an altered HYPLIPI or FCHL1 mucleotide sequence and a paramaceutical composition. Also disclosed is a transagenic animal which carries an altered HYPLIPI or FCHL1 allele and a method for screening drugs for inhibition or restoration of FCHL1 gene function as an antimal and antibodies are useful for treating or preventing (e.g. gene therapy) a lipid disorder associated with expression of FCHL1, for diagnosis or prequence in a land disorder second and a method for screening a lipid disorder second and propertion and antibody areary disease, atherogenic lipoportein phenomy, leading and occupant areary disease, atherogenic lipoportein and hyperingly perintiply correctly a propertic lipoporteinaemia, hypertriglycetide mineral lipoporteinaemia, hypertriglycetide mineral lipoporteinaemia, hypertriglycetide mineral lipoporteinaemia, hyperspecial correct and for correct lipoporteinaem

The present invention relates to a method of inducing differentiation of mammalian embryonic stem cells into functioning cells, which comprises culturing embryonic stem cells in a medium comprises judicated basic fibroblast growth factor. In particular, the invention relates to the differentiation of mammalian embryonic stem cells. The method is useful for inducing differentiation of mammalian embryonic stem cells. The method contribution disorders in pancreatic function, and in nerve function. The cells are pancreatic islet like cell clusters and nerve function. The relatest pancreatic function, and in nerve function method may be used for treating disorders in pancreatic islet function (e.g. Alzheimer's disease and creutzfeldt-Jakob disease) or spinal cord disorders. The functioning cells are useful not only for cell transplant therapy, but for in vitro screening of various new drugs which affect or restore islet or nerve function, and for safety evaluation of new drugs. The present sequence is a PCR primer used in the exemplification of the invention

Sequence 20

Inducing differentiation of mammalian embryonic stem (ES) cells into functioning cells, for treating e.g. diabetes, comprises culturing ES cells in a medium containing leukemia inhibitor factor and basic fibroblast growth factor.

Example 5; Page 67; 70pp; English.

The invention discloses a method for amplifying expressed genetic sequences from genomic DNA (gDNA) from mammalian or higher order plant species. The method involves identifying a 3' untranslated region (UTR) of a gDNA sequence, designing probe, performing a second PCR to amplify the predetermined sequence. Also claimed is a biological analysis device, comprising a substrate and an array of set of expressed genetic sequences, located on the substrate, which are generated by the method above and a DNA high-density microarray comprising a substrate upon which are deposited an array of blosites of genomic DNA fragments having the sequence of at least one exon, and absent polyadenine and vector sequences, where the genomic DNA fragments have a sequence length of from about 75-200 nucleotides. The method is efficient for amplifying gene captures, enables large-scale production of gDNA sequence, generates large quantities of gDNA probes, which enables greater efficiency for printing in microarray formats, fabricates high-density DNA arrays of enhanced, widely varying genetic content and abstains from using RNA-derived sequences by simple PCR amplifications without cloning. The method produces amplified sequences that have greater specificity and size consistency than that observed with cDNA fragments, and allows for greater signal sensitivity than oligonucleotides. The sequence presented is a Type II gene specific primer
                                                                                                                                                                                                                                                                                                                                                                     PCR; primer; ss; genomic DNA; gDNA; untranslated region; UTR;

The invention describes an isolated polypeptide (I) comprising a variant form of a mouse HYPLIPI polypeptide sequence (S1) or a human FCHLI polypeptide sequence (S1) or a human FCHLI polypeptide sequence (S1) or a mainto acid sequence the variant form is associated with cancer, or an amino acid sequence having at least 65 % sequence identify to (S1) or (S2). A composition comprising the expression of FCHLI. FCHLI gene or HYPLIPI gene and its product are useful for the study of metabolic pathway and cellular mechanism to identify other genes, receptors and relationships that contribute to lipid disorder and cancer. FCHLI gene or its fragments are useful in gene the reatment of lipid disorder or cancerous cells. The sequence the treatment of lipid disorder or cancerous cells. The sequence variation of FCHLI gene or HYPLIPI gene is also useful in the disgnosis and prognosis of predisposition to lipid disorder and cancer. Antisense polymuclectide sequences are useful in preventing or diminishing the expression of HYPLIPI or mouse HYPLIPI gene.
                                                                                                                                                                                                                                  cytostatic, antilipemic; gene therapy; peptide therapy; HYPLIPI; FCHLI; cancer; metabolic pathway; cellular mechanism; lipid disorder; familial combined hyperlipidaemia; mouse; PCR; primer; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Novel human FCHLI or mouse HYPLIPI polypeptide, useful for drug screening, peptide therapy of lipid disorder or cancer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Lusis AJ;

The invention discloses a polynucleotide comprising a sequence selected from 1970 fully defined nucleotide sequences which encode novel polypeptides. Also claimed is a polypeptide encoded by the polynucleotide, a manibody binding to the polypeptide or peptide or its partial peptide, an antibody binding to the polypeptide or peptide of the polynucleotide by contacting the polypeptide or peptide with the antibody of the encoded by contacting the polypeptide or peptide with the antibody of the encoded by contacting the polypeptide or peptide with the antibody of the encoded by contacting the polynucleotide in an expressible manner and an antisense polynucleotide, or as a probe for detecting the polynucleotide. The polynucleotide, or as a probe for detecting the polynucleotide. The polynucleotide and encoded is useful as parimer for synthesising the polynucleotides and encoded proteins are useful as pharmaceutical agents and many diseaser-related genes may be included in them, for developing a diagnostic marker or medicines for regulation of their expression and activity, or as targets of gene therapy. The genes are involved in tissue and/or cell respensation. Membrane proteins, signal transduction-related proteins, respense for diseases (e.g. osteoporosis, renocing them can be used as indicators for diseases (e.g. osteoporosis, neurological diseases, cancer, tumours. The cDNA may be used to regulate the activity or expression of the encoded protein to treat diseases. The sequence presented is clone specific PCR primer which was used in the sequence data for this patent is not represented in the printed sequence data for this patent is not represented in the printed sequence information supplied by the

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              The invention relates to a method of treating or preventing allergy or asthma which comprises administering to a subject a poly-G nucleic acid in an aerosol formulation. The methods and compositions of the present invention are useful for diagnoshing and/or treating asthma and allergy especially in a hypo-responsive subject. The present sequence represents an immunostimulatory nucleic acid of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Treating and/or preventing allergy or asthma using an immunostimulatory nucleic acid alone or in combination with an asthma/allergy medicament.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Gaps

The invention comprises antisense oligonucleotides that are targeted to the nucleic acid encoding transforming growth factor beta (TGF-beta) receptor II. The antisense oligonucleotides of the invention are useful for treating: hyperproliferative disorders (e.g. breast cancer), or an autoimmune disorder (e.g. prheumatoid arthritis). The present DNA sequence represents a 2'-O-methoxyethyl gapmer oligonucleotide with a phosphorothioate backbone that is targeted to mouse TGF-beta receptor II.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                 New compound having a sequence targeted to a nucleic acid encoding
Transforming growth factor beta-receptor II, useful for preparing a
composition for treating hyperproliferative disorder e.g., lung, liver,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               ss; primer; cytostatic; antidiabetic; anorectic; cerebroprotective; neuroprotective; antiinflammatory; gene therapy; antisense therapy; thyromimetic; NoVx; pathology; cancer; diabetes; obesity; endocrine disorder; CNS disorder; inflammatory disorder; chromosome mapping; tissue typing; predictive medicine.

The invention relates to novel isolated polypeptides, mature form of the polypeptide, a sequence that is 95% identical to the polypeptide or the polypeptide comprising one or more conservative substitutions. The NOVX polypeptide is useful for treating or preventing a pathology associated with the polypeptide e.g. disorders associated with aberrant expression or activity of the polypeptide, such as cancer, diabetes, obesity, and candocrine, CNS and inflammatory disorders. They can also be used in various detection and screening assays, chromosome mapping, tissue typing and predictive medicine. This sequence corresponds to a primer used to amplify and isolate the coding sequence for one of the polypeptides of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Kekuda R;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                New isolated NOVX polypeptides and nucleic acid molecules useful for treating, preventing and diagnosing pathological conditions with NOVX-associated disorders, such as cancer, obesity, diabetes and inflammatory
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Agee ML, Anderson DW, Berghs C, Casman SJ, Catterton E;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            The invention relates to a method of inhibiting corneal allograft rejection, by contacting the allograft with a topical formulation comprising an antisense oligonuclectide targeted to intercellular adhesion molecule-1 (ICAM-1), extracellular adhesion molecule-1 (ICAM-1) or vascular cell adhesion molecule-1 (VCAM-1). The oligonucleotide is useful for inhibiting corneal allograft rejection or for preserving a corneal explant ex vivo, where the explant is human. This sequence

The formulation is used for treating inflammatory bowel discase, e.g. ulcerative colitis, Croin's disease or inflammatory bowel discase, in animals (e.g. human). It can also be used for treating undue cellular proliferation. The present sequence is an antisense oligonucleotide targetted to human intracellular adhesion molecule (ICAM-1) gene. This sequence is used to illustrate the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Formulation, useful for treating inflammatory bowel disorder, e.g. ulcerative colitis or Crohn's disease, comprises oligonucleotide for rectal delivery.
                                                                                                                                                                                                                                                                                                                                                                                Inflammatory bowel disorder; ulcerative colitis; Crohn's disease; cellular proliferation; intracellular adhesion molecule; ICAM-1; phosphorothicate backbone; antisense; human; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Manoharan

New antibody that binds to an epitope of an inducible human phosphofructokinase-2 isozyme, useful for diagnosing or treating cancer, inflammation or cachexia.
                                                Cytostatic; immunomodulator; phosphofructokinase isozyme; iPFK; cancer; inflammation; cachexia; enzyme linked immunosorbant assay; ELISA; therapy; phosphorothicate; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          The present invention relates to an isolated antibody that binds to an epitope of an inducible human phosphofructokinase-2 (iPFK-2) isozyme. T antibody is useful for treating cancer, inflammation and cachexia. The antibody can also be used in enzyme linked immunosorbant assay (ELISA) immunological assays. The present sequence is S-iPFK-2 sense phosphorothicate oligonucleotide
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  DNA vaccine, flatfish rhabdovirus, HIRRV, fish; immunity; transcriptional-control, cytomegalovirus immediate-type promoter; immunogenic; virucide, gene gun; ss; primer.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    The present invention relates to an isolated antibody that binds to an epitope of an inducible human phosphofructokinase-2 (iPFK-2) isozyme. The antibody is useful for treating cancer, inflammation and cachexia. The antibody can also be used in enzyme linked immunosorbant assay (ELISA) immunological assays. The present sequence is AS-iPFK-2 antisense phosphorothioate oligonucleotide
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           New antibody that binds to an epitope of an inducible human phosphofructokinase-2 isozyme, useful for diagnosing or treating cancer,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Gaps

This invention describes a novel method for identifying an inhibitor potentially useful for treatment of cancer, where the inhibitor is active on a gene vital for cell growth or viability, and where the gene is subject to loss of heterozygosity (LOH) in a cancer. The inhibitor is used for preventing the development of cancer in a patient having a precancerous condition, by administering to the patient a first allele specific inhibitor (AsI) targeted to an allele of a first essential gene present in cells of the precancerous condition, where the normal somatic cells of the patient are heterozygous for the first gene, the inhibitor is active on at least one but less than all allelic forms of the gene normal somatic cells, and the first gene. The products and methods can be normal somatic cells, and the first gene. The products and methods can be
                                          The invention relates to a novel method for typing a single nucleotide belynarizins (SNP) using a small amount of genomic DNA comprising simultaneous amplification of plural base sequences containing one or more SNP sites and differentiation of the bases within the SNP sites. The method of the invention may be useful for typing several hundred thousand SNP sites using only a comparatively small amount of genomic DNA. The current sequence is that of the SNP typing-related PCR primer of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        cell viability; loss of heterozygosity; precancerous condition; ASI; allele specific inhibitor; somatic cell; diagnosis; prevention; atherosoclerotic plaque; premalignant metaplastic lesion; endometriosis; dysplastic lesion; bengn tumour; polycystic kidney disease; transplant; graft versus host disease; malignant cell removal; bone marrow; ss.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        ö
                                                                                                                                                                                                                                                                                                                                                                                                             The invention relates to a novel DNA vaccine for flatfish rhabdovirus (HIRRV) infected fishes, which provides immunity against HIRRV. The vaccination method uses a DNA construct comprising a transcriptional-control sequence containing cytomegalovirus immediate-type promoter, operably coupled to a nuclectide sequence encoding an immunogenic polypeptic of HIRRV. The DNA vaccine has virucide activity. The HIRRV DNA vaccine is useful for administering to a fish belonging to the flatfish family by gene gun. The HIRRY DNA vaccine is useful for inducing preventing HIRRV infection in flatfish. The HIRRV DNA vaccine is effective in enhancing immunity of fish infected by HIRRV. This polymucleotide sequence represents an oligo used in the analysis of the mRNA expression level from the muscles of flatfish, following an innoculation with the flatfish rhabdovirus vaccine of the invention.
                                                                                                                                                                                                                                                                  DNA vaccine for flatfish rhabdovirus infected fishes has DNA construct comprising a transcriptional control sequence coupled to a nucleotide sequence encoding an immunogenic protein of flatfish rhabdovirus.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 The present invention provides a method of diagnosing a vascular disease in an individual, involving determining the sequence at various oblymorphic sites within the human thrombospondin 1 and thrombospondin 4 genes. The sequences at a number of polymorphic sites are also provided in the specification. In particular, the method can be used in the diagnosis of atherosclerosis, myocardial infarction, coronary heart disease, stroke, peripheral vascular diseases, venous thromboembolism and pulmonary embolism. Single nucleotide polymorphisms (SNPs) are also useful in forensics, paternity testing, genetic analysis and phenotype
                    cancers, atherosclerotic plaques, premalignant metaplastic or dysplastic lesions, benign tumours, endometricsis, polycystic kidney disease, and graft versus host disease. The method can also be used to remove malignant cells from bone marrow transplants. AAZ25812-Z26825 represent human polymorphic sites described in the method of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Human; variant thrombospondin 1; variant thrombospondin 4; SNP; polymorphism; vascular diesase; coronary artery disease; forenaics; myocardial infarction; atherosclerosis; stroke; venous thromboembolism; pulmonary embolism; paternity test; ds.
    used in the diagnosis, prevention and treatment of LOH disorders, e.g.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Mccarthy JJ;

Ribozymes having modified bases and methods for producing them - for in inhibiting disease related genes.

Claim 2; Page 228; 407pp; English.

The present sequence represents a preferred target sequence for an enzymatic nuclecided acid (i.e. a ribozyme) which cleaves relA mRNA at the nucleotide base position indicated in the DE line. The reAA game product is a subunit of the transcriptional regulator NF-kappaB and is implicated specifically in the induction of inflammatory responses. Regions of the mRNA that do not form secondary folding structures and that contain potential hammerhead and hairpin ribozyme cleavage sites were identified by computer analysis. Ribozymes directed against these mRNA sequences were designed and synthesised with modifications that improve their

```
ö
                 sequences and thereby inhibit relA expression, making them potentially useful for treating rheumatoid arthritis, restenosis and asthma as well as for increasing tolerance to transplanted tissues. The potential immunosuppressive properties of a ribozyme that cleaves relA mRNA means that uses are limited to local delivery, acute indications or ex vivo treatment. Nucleic acid molecule modulating VEGF receptor(s) gene expression or mRNA stability - useful for treating e.g. tumour angiogenesis, psoriasis, rheumatoid arthritis, etc., in a human patient.

Example 9; Page 191; 218pp; English.

The present invention describes nucleic acid molecules which modulate the synthesis, expression and/or stability of a mRNA encoding 1 or more receptors of vaccular endothelial growth factor (WRGP). A patient (preferably human) having a condition associated with the level of the fms-like tyzosine kinase 1 (EL-1), kinase insert domain containing receptor (KDR) and/or foetal liver kinase 1 (flk-1) (e.g. tumour angiogenesis, ocular diseases, psoriasis and rheumatoid arthritis) can be treated by administering the nucleic acid molecule arthritis) can be vector to the patient. AAX67275 to AAX75752 represent specific examples of nucleic acid molecules from the present invention

The present sequence represents a hybridisation probe used to differentiate between pathogenic and vaccine strains of cattle brucallosis. The method comprises digestion of DNA from the test strain with restriction enzyme Nco 1, transfer of the fragments obtained to filters, subsequent fixing of these onto the filters, hybridisation with a labelled sample, and examination of the results. (Updated on 25-MAR-2003 to correct PI field.)
                                                                                                                                                                                                                                                                                                                                                  Differentiating pathogenic and vaccine strains of cattle brucellosis - using restriction digestion with Nco 1 and transfer of the DNA fragments to filters in an electric field.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Tag sequence; colorectal cancer; pancreatic cancer; colon cancer; diagnosis; prognosis; treatment; ss.

The method comprises digetion of DNA from the test strain with restriction enzyme Nco 1, transfer of the fragments obtained to filters, subsequent fixing of these onto the filters, bybridisation with a labelled sample, and examination of the results. (Updated on 25-WAR-2003 to correct PI field.)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Differentiating pathogenic and vaccine strains of cattle brucellosis -
using restriction digestion with Nco 1 and transfer of the DNA fragments
to filters in an electric field.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Gaps

AAX30947-31815 represent tag sequences of transcripts that are differentially expressed in colorectal cancer, in pancreatic cancer, or in both. The tag sequences can be used to identify genes by matching the tag to a gen data base member, or by using the tag sequences as probes to isolate unidentified genes from cDNA libraries. The tag sequences can also be used in a method for diagnosing colon or pancreatic cancer in a sample suspected of being neoplastic. The method comprises comparing the level of at least one transcript in a first sample of a tissue to a second sample, where the first sample is a colonic tissue suspected of being neoplastic and the second sample is a normal human colonic tissue. The transcript is identified by a tag selected from AAX30947-31815. The methods of the invention can be used in the diagnosis, prognosis and
               Use of isolated gene transcripts - useful for developing products for diagnosis, prognosis and treatment of cancers, particularly colon and pancreatic cancer.

weethod (I) has been developed for generating, in the same reaction vessel, a selected set of codons (II). The method comprises providing two (optionally three) sets of monouncleosides, monouncleotides, (optionally three) sets of monouncleotides, and three sets of monouncleotides or mixtures of these and optionally repeatedly adding a third set, where (II) includes at least one codon having A or G at the third set, where (II) includes at least one codon having A or G at the third set, where (II) includes at least one codon having a or a stop codon. Also described is a method (II) for generating an oligomucleotide from (II), comprising the method (II), followed by repeating the method or until an oligomucleotide of the desired length is achieved. (I) and (II) are useful for chemically synthesising DNA or NNA. The DNA sequences generated provide a wide variety of protein products useful in pharmaceutical research. In particular the methods are useful in pharmaceutical research. In particular the methods are useful in techniques, ribosome display techniques and protein-uncleic acid fusion techniques. Codon-randomised DNA can also be used in cellular cultures (in vivo) for protein expression, or for in vitro applications using, equence represents an oligomucleocide which is used in the present exemplification of the present invention
                                                                                                                                                                                        ö
obtain accurate sequence estimate. (I) is useful for a research and medical applications. (I) minimises error rates in sequencing or testing nucleic acids. The present sequence represents an original DNA template which is used in the exemplification of the present invention
                                                                                                                                                                                        Gaps

Sequence 15 BP; 3 A; 5 C; 4 G; 3 T; 0 U; 0 Other;

The present invention describes a method (I) for extracting a sequence of bases from a dideoxyribonucleic acid (dDNA) template. The method comprises forming a set of products (P) selected to implement a code with desirable error correcting characteristics from the template through chemical reactions, obtaining a set of signals (S) from (P) by DNA sequencing and using the code to recover the base sequence from (S), to

Extracting sequences of bases from dideoxyribonucleic acid templates research and medical applications, involves creating a new set of molecules which introduce error correcting code, from the template.

The present invention relates to a method for ameliorating the effects of skin disorders. The method comprises contacting the skin with an antisense oligonucleotide, (for Insulin-like Growth Factor [GGF] - receptor, IGF binding protein [IGFB]-2 or IGFBB], which is capable of inhibiting or reducing growth factor mediated cell proliferation, inflammation and/or other disorders. The present sequence is an oligonucleotide which can be used to design the antisense oligonucleotide which can be used to design the antisense oligonucleotides of the present invention (see AAF45151 and AAF45153 - F45161). The method is useful for ameliorating the effects of psoriasis, ichthyosis, pivylasis, tuba, pilaris, serborrhoea, keloids, keratosis, chthyosis, scleroderma, warts, benign growths, cancers of the skin, a hyperneovascular condition auch as a neovascular condition of the retina, brain or skin, growth factor-mediated mailgnancies, other sclerotic disease, kidney disease, hyperproliferation of the inside of blood
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Ameliorating the effects of a disorder, e.g. psoriasis, by administering UV (ultra-violet) treatment (optional) and an antisense nucleic acid that inhibits or reduces growth factor mediated cell proliferation and/or
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Gaps

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          inflammation.
ઠ
```

The present invention relates to a method for ameliorating the effects of shin disorders. The method comprises contacting the skin with an antisense oligonucleotide, (for Insulin-like Growth Factor [IGF]-1 receptor, IGF binding protein [IGFBB]-2 or IGFBB3), which is capable of inhibiting or reducing growth factor mediated cell proliferation, inflammation and/or other disorders. The present sequence is an oligonucleotide which can be used to design the antisense oligonucleotides of the present invention (see AAF4151 and AAF45153-F45161). The method is useful for ameliorating the effects of psoriasis, ichthyosis, pityriasis, ruba, pitaris, serborrhoea, keloids, keratosis, ichthyosis, pityriasis, ruba, pitaris, serborrhoea, keloids, keratosis, hyperneovascular condition such as a neovascular condition of the retina, brain or skin, growth factor-mediated malignancies, other sclerotic disease, hyperproliferation of the inside of blood

The present invention relates to a method for ameliorating the effects of skin disorders. The method comprises contacting the skin with an antisense oligonuclectide, (for Insulin-like Growth Factor [IGF]-1 receptor, IGF binding protein [IGFB]-2 or IGFBP3), which is capable of inhibiting or reducing growth factor mediated cell proliferation.

Inflammation and/or other disorders. The present sequence is an oligonuclectide which can be used to design the antisense oligonuclectide which can be used to design the antisense oligonuclectide which can be used to design the effects of psoriasis, oligonuclectides of the present invention (see AAF45151 and AAF45153-F45161). The method is useful for ameliorating the effects of psoriasis, neoplasias, soleroderma, warts, benign growths, cancers of the skin, a hyperneovascular condition such as a neovascular condition of the retina, the brain or skin, growth factor—mediated malignancies, other sclerotic disease, kidhey disease, hyperproliferation of the inside of blood vessels or any other hyperplasia

The present invention relates to a method for ameliorating the effects of skin disorders. The method comprises contacting the skin with an antisense oligonucleotide, (for Insulin-like Growth Factor [IGF] receptor, IGF binding protein [IGFBP] - or IGFBPB), which is capable of inhibiting or reducing growth factor mediated cell proliferation, inflammation and/or other disorders. The present sequence is an oligonucleotide which can be used to design the antisense oligonucleotides of the present invention (see AAF45151 and AAF45153 oligonucleotides of the present invention (see AAF45151 and AAF45153 olifothyosis, pityriasis, ruba, pilaris, serborrhoea, keloids, keratosis, neoplasias, scleroderma, warts, benign growths, cancers of the skin, a hypermeovacular condition such as a neovascular condition of the retina, brain or skin, growth factor-mediated malignancies, other sclerotic meneral or skin, growth factor-mediated malignancies, other sclerotic meneral or skin, schero hyperprioliferation of the inside of blood Wraight CJ, Werther GA, Edmondson SR (MURD-) MURDOCH CHILDRENS RES INST. ```
The present invention describes a method for detecting mutations associated with anti-HV drug resistance in a patient by desecting at least one of the mutations K103N/R, V106A/IL, Y18LCI, M184V/I, Y18BL, C190A/S/R, T215Y/F/D/S/A and/or O151M/L in the reverse transcriptase (RT) of HV strains in a biological sample using a specific set of probes optimised to function together in a reverse-hybridisation assay. The method and the nucleic acid sequences used in the method are useful for determining viral mutations and/or polymorphisms in the HIV RT gene associated with resistance. The probes are useful for the genetic detection, preferably in vitro detection of the mutations K103N/R, V106A/I/L, Y18IC/I, O151M/L, M184V/I, Y18BL, G190A/S/R and/or C151SY/F/D/S/A in the RT of HIV strains in a biological sample, where the mutation is associated with anti-HIV drug resistance. The method provides a rapid, reliable and precise assay or determination and monitoring of antiviral drug resistance or mutation associated with drug resistance of viruses containing RT genes. ABZ34642 represent HIV RT containing RT genes. ABZ34542 represent HIV RT contains and probes which are used in the exemplification of the present
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             ö

The invention relates to an isolated, purified human nucleic acid (I) that has the same sequence as a mRNA found in humans and is a SAGE (serial analysis of gene expression) tag comprising a single stranded probe containing at least 10 consecutive nucleotides. SAGE tags, are diagnostic and prognostic markers of cancer, especially of the colon and pancreas. ABK31900-ABK32770 represent human colon and pancreatic cancer SAGE tags of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Gaps

The sequences given in AAT32673-76 represent effective, and those in AAT32673-76 and those in AAT32673-76 and the sequence probe pool. Hybritope mapping describes a method of determining superior sites for binding oligomocleotides to a target sequence, to identify improved discontinuous probes with high binding constants. The method comprises obtaining a series of oligomocleotides which are complementary to a known target sequence and which overlap each other by 1-4 mucleotides. Each of these sequences is contacted with the target sequence to permit specific hybridisation, and detecting the presence or absence of specific hybridisation to determine oligomucleotides which bind within the known target sequence. This sequence contacted with the sprace of specific hybridisation to determine oligomucleotides which bind within the known target sequence. This number of this probe corresponds to the 5' position on the HIV sf2 target to which the 3' end of the probe binds
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          antisense; cytomegalovirus; CMV; human; therapy; prophylaxis; diagnosis; intermediate early complex; IE1; IE2; DNA polymerase gene; ss.
                                                                                              Detecting target binding oligo-nucleotide(s) - using oligo-nucleotide probes with a nucleotide sequence which binds within a known sequence of a target nucleic acid.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Query Match 0.8%; Score 13.4; DB 1; Length 16; Best Local Similarity 93.3%; Pred. /note= "at least one (and preferably all) of the backbone
subunits are composed of amide units, so that the
oligomer consists of the nucleobases attached covalently
to a polyamide backbone"
                                                                                         AAT11971-84 are antisense oligonucleotides (ONS) against human expressed vertivities of at least 50 % of control (ISIS 2922 shown in APA11961). It was found that up to 4 internal mismatches could be tolerated without loss of antiviral activity. Antisense ONS targeting CMV DNA or RNA coding for the ISI, ISE2 or DNA polymerase proteins have been shown to be effective in therapy, prophylaxis and diagnosis of CMV infection. The ONS may be modified to prophylaxis essistence and to increase their efficacy. Modifications include phosphorothicate backbones, alkyl and halogen-substituted sugar mojeties at the 2' position. (Updated on 25-MAR-2003 to correct PF
New oligo-nucleotide inhibits cytomegalovirus replication - by binding to a portion of cytomegalovirus RNA, for the diagnosis, prophylaxis and treatment of CMV diseases.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  New peptide nucleic acid oligomers hybridisable to cytomegalovirus or papilloma:virus - are stable anti:sense molecules with high affinity for single stranded DNA, used for treating infections.

untranslated region, intron/exon (I/E) junction or coding sequence of cytomarslated region, intron/exon (I/E) junction or coding sequence of cytomegalovirus gene selected from DNA polymerase, IEI and IEI, or hybridisable to the E, EZ, E4, E5, E6, E7, L1 or L2 reading frames of a papillomavirus. The PNAs can be used to target RNA and single stranded DNA (ssDNA) to produce antisense-type gene regulation moieties. Hence they may be used therapeutically for modulating cytomegalovirus and papillomavirus processes and also as diagnostics (e.g., as probes for specific mRNAs). PNA oligomers have high affinity for complementary specific mRNAs). PNA oligomers have high affinity for complementary single stranded DNA. They are also able to form triple helices in which a first PNA strand binds with RNA or ssDNA and a second PNA strand binds with RNA or ssDNA and a second PNA strand. The PNAs possess no significant charge and are water soluble, which facilitates possess no significant charge and are water soluble, which facilitates cellular uptake. Futher, since they contain amides of non-biological amino acids, they are biostable and resistant to enzymatic degradation by processes. The present sequence targets CMV IEZ nuclear localisation

A patient (preferably human) having a condition associated with the level of the fme-like tyrosine kinase 1 (flt-1), kinase insert domain containing receptor (KDR) and/or foetal liver kinase 1 (flt-1) (e.g. tumour angiogenesis, ocular diseases, psoriasis and rheumatoid arthritis) can be treated by administering the nucleic acid molecule or the expression vector to the patient. ANX67275 to ANX75752 represent specific examples
fms-like tyrosine kinase 1 (flt-1), kinase insert domain containing receptor (KDR) and/or foetal liver kinase 1 (flk-1) (e.g. tumour anglogenesis, ocular diseases, psoriasis and rheumatoid arthritis) can be treated by administering the nucleic acid molecule or the expression vector to the patient. AAX67275 to AAX75752 represent specific examples of nucleic acid molecules from the present invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           mRNA
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Vascular endothelial growth factor receptor; VBGF receptor; flt-1; flk-1; VBGF remerhead ribozyme; hairpin ribozyme; cleavage; tumour angiogenesis; psoriasis; rheumatoid archritis; coular disease; fms-like tyrosine kinase 1; kinase insert domain containing receptor;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Nucleic acid molecule modulating VEGF receptor(s) gene expression or
stability - useful for treating e.g. tumour angiogenesis, psoriasis,
rheumatoid arthritis, etc., in a human patient.
                                                                                                                                                                                                                  ..

Sequences AAV69693 and AAV69694 represent nested oligonucleotide probes corresponding to the exon 1 of the human glial cell line-derived neurotrophic factor (GDNF) gene. These were used to identify the neurotrophic factor (GDNF) gene. The invention relates to the use of the human GDNF promoter which contains a proximal section which ensures consistent low level GDNF expression in multiple cell types, and a distal section designed to alter transcription during development and in response to environmental stimuli. The GDNF promoter can be used for expressing GDNF in a cell, for identifying modulators and binding contacts can be used for identifying and treatment of disorders involving GDNF such as neural degeneration, e.g. seizures, Parkinson's disease, Lou Gehrig's disease, and various developmental defects resultant from the gromoter as also used for gene therapy and for expressing heterologous genes for treating e.g. severe combined immunodeficiency, haemophilia or
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       New isolated glial cell line-derived neurotrophic factor promoter - used to develop products for treating e.g. neuronal degeneration, immunodeficiency, haemophilia or proliferative disorders such as cancers.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 The present invention describes enzymatic nucleic acid molecules (NAMs) which specifically cleave RNA derived from an epidermal growth factor receptor (EGF-R) gene. AAV9721 to AAV98043 and AAV98039 to AAV990900 represent specifically claimed target sequence from human EGF-R. AAV98044 to AAV98066 and AAV98867 to V9978 represent hammerhead ribozymes and hairpin ribozymes respectively for human EGF-R. The NAMs are useful for cleaving EGF-R RNA in the treatment of a condition associated with EGFR expression levels e.g. to inhibit cell proliferation in the prevention or treatment of cancers. The NAMs can also be used as diagnostic tools to examine genetic drift and mutations within diseased cells or to detect the presence of EGF-R RNA in a cell
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Enzymatic nucleic acids - which cleave RNA derived from an epidermal growth factor receptor, useful for inhibiting cell proliferation and for

Antisense oligonucleotides (AAX17861-X17924) are targeted to a nucleic acid (AAX17925-X17948) encoding IE (immediate early) 1 or 2, or DNA polymerase of cytomegalovirus (CMV) and are able to inhibit CMV replication. Optionally the oligonucleotides include at least one 2'-(2-methoxyethoxy) sugar modification or phosphorothhoate internucleotide inchayes. The oligonucleotides are used to inhibit CMV infections (by in vivo or in vitro contact with cells, tissues or body fluids), especially to treat or prevent CMV infections, particularly retinitis . The present invention describes enzymatic nucleic acid molecules with RNA cleaving activity, which specifically cleave RNA encoded by an aryl nuclear transporter (ARVT) gene, an integrin submit beta 3 gene, an integrin alpha 6 submit gene, or a Tie-2 gene, AAA16775 to AAA17651 to AAA17651 to AAA17652 represent ribozyme sequences for ARNT, and AAA17651 to AAA17652 represent ribozyme sequences for AAA1369 and AAA1369 to AAA1365 to AAA17650 to AAA1369 to AAA1365 to AAA1365 to AAA1365 to AAA1365 to AAA1365 to AAA1369 to AAA1365 to AAA13622 represent their corresponding target sequences; AAA1355 to AAA21561 and AAA21561 to AAA21595 represent ribozyme sequences; AAA1355 to AAA21689 to AAA21591 to AAA21591 and AAA21591 to AAA21592 to AAA21590 and AAA21595 to AAA21569 and AAA21592 represent their corresponding target sequences; AAA21595 to AAA21592 and AAA22250 to AAA23262, AAA23343 to AAA21689 to AAA22475 and AAA22250 to AAA23262, AAA23343 to AAA23472 represent their corresponding target sequences; for integrin subunit beta 3, and AAA23476 to AAA23262, AAA23343 to AAA2169 to AAA22475 and AAA22261 to AAA23262, AAA23343 to AAA21691 their corresponding target sequences. The ribozyme sequence corresponding target sequences; the invention and warmanity are accepted for modulating target sequences. They are sepecially used to treat cancer, diabetic retinopathy, age related mecular degeneration (ARMD), inflammation, and arthritis, as well as necular degeneration (ARMD), inflammation, and arthritis, as well as necular degeneration (ARMD), inflammation, and arthritis, as well as necular degeneration (ARMD), inflammation, and arthritis, as well as necular degeneration (ARMD), inflammation, and arthritis, as well as necular degeneration (ARMD), inflammation, and arthritis, as well as necular degeneration (ARMD), inflammation, and arthritis, as well as and other syndrome, whose related to treat cancer, diabetic retinopathy, age related and diabeted to treat cancer, diabetic retinopathy, age related and other syndrome, and diabete
                                                                                                                                                                                                                                                                                                      Novel ribozymes for modulating the synthesis, expression and/or stability of an mRNA encoding an angiogenic factors.
                                                                                                                                                                                   Coeshott C, Mcswiggen JA

Integrin subunit beta 3 substrate sequence SEQ ID NO:6483.

Human; aryl hydrocarbon nuclear transport; ARNT; TIE-2; angiogenesis; integrin alpha 6 subunit; integrin subunit beta 3; hairpin ribozyme; hammerhead ribozyme; angiogenic factor; cyrostatic; antidiabetic; ophthalmologic; antiinflammatory; antiarthritic; antipsoriatic; ARND; dermatological; RNA cleavage; cancer; diabetic retinopathy; arthritis; age related macular degeneration; inflammation; neovascular glaucoma; myopic degeneration; psoriasis; verruca vulgaris; angiofibroma; tuberous sclerosis; por whee stain; Sturge Weber syndrome; Kippel-Trenaumay-Weber syndrome; ss. 

Homo sapiens

```
The present invention describes enzymatic nucleic acid molecules with RNA cleaving activity, which specifically cleave RNA encoded by an aryl cleaving activity, which specifically cleave RNA encoded by an aryl cleaving activity, which specifically cleave RNA encoded by an aryl controlled an integrin alpha 6 subunit gene, or a Tie-2 gene. AAA16775 to AAA1167 and AAA1766 to AAA1762 represent ribozyme sequences for AAA1767 to AAA19185 and AAA1986 to AAA1886 to AAA1886 to AAA1886 to AAA1888 to to AAA2188 to to AAA1888 to to AAA2188 to to AAA1888 to to AAA188 to to AAA1888 to to AAA288 to to AAA1888 to to AAA1888 to to to AAA1888 to to AAA1888 t
                                                                                                                                                                                                                                                                                                                                                                                                              Novel ribozymes for modulating the synthesis, expression and/or stability

AAA20471 standard; RNA; 17 BP 19-JUN-2000 (first entry) AAA20471; RESULT 1450 AAA20471 

Integrin alpha 6 subunit substrate sequence SEQ ID NO:3697.

Human, aryl hydrocarbon nuclear transport, ARNT, TIE-2; angiogenesis; integrin alpha 6 subunit; integrin subunit beta 3; hairpin ribozyme; hammerhead ribozyme, angiogenic factor; cytostatic; antidabetic; ophthalmologic; antiinfiammatory; antiarthritic; antibsoriatic, ARND; dermatological; RNA cleavage; cancer; diabetic retinopathy; arthritis, age related macular degeneration; inflammation; neovascular glaucoma;

```
The present invention describes enzymatic nucleic acid molecules with RNA cleaving activity, which specifically cleave RNA encoded by an aryl cleaving activity, which specifically cleave RNA encoded by an aryl of hydrocarbon nuclear transporter (ARNY) gene, an integrin subunit beta 3 gene, an integrin alpha 6 subunit gene, or a Tie-2 gene. AAA16775 to and AAA1166 to AAA1766 and AAA1168 to AAA1766 to AAA1684 represent their corresponding target sequences; AAA19154 represent their corresponding target sequences; AAA19155 to AAA19222 represent their corresponding target sequences; AAA19223 to AAA2185 to AAA1922 represent their corresponding target sequences; AAA19223 to AAA2185 to AAA1922 represent their corresponding target sequences; AAA19223 to AAA2185 to AAA2
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Novel ribozymes for modulating the synthesis, expression and/or stability of an mRNA encoding an angiogenic factors.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Oestrogen receptor hammerhead ribozyme target sequence SEQ ID NO:1300.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Gaps

The present invention describes nucleic acids (A) that interact stably with a target sequence and contain at least one phosphoro(dilthicate link, having endonuclease activity. (A), and more generally any catalytic nucleic acid (A') that modulates expression of the osestrogen receptor.

Some, are used to treat cancer (particularly of breast or endometrium).

In vivo or by transforming cells ex vivo and implanting treated cells, or for other conditions associated with levels of osetrogen receptor.

Because of the high selectivity for targeted RNA, (A) can also be used to correlate inhibition of gene expression with alterations in phenotype, particularly for identification of therapeutic targets, and as research regents (for RNA, in the same way that restriction endomucleases are used with DNA). The combination of modifications in (A) improves resistance to nucleases, binding affinity and/or activity. AAA2393 to AAA24747 represent osetrogen receptor harmerhead riboxyme sequences, and AAA2593 to paracologen receptor harmerhead riboxyme sequences, and AAA26107 to AAA36218 represent their corresponding target sequences and invention of the present in the exemplification of the present
                                                                                                                                                                                                                                                                                                                                                                                                                                                         nucleic acids that interact, and optionally cleave, target sequences,

```
The invention relates to a nucleic acid molecule which down regulates expression of a CD20 gane and a nucleic acid molecule which down regulates expression of a neurite growth inhibitor gene (NOGO). The regulates expression of a neurite growth inhibitor gene (NOGO). The mother acids may be enzymatic nucleic acid cleaving a an RNA molecule possessing an NCH motif), a G-cleaver (cleaving RNA with a CD20 in the presence of a divalent cation that is preferably Mg^2+, corp. in may be contacted with a coll to reduce CD20 activity of corp. The treatment may further comprise the use of one or more chost in particular, the CD20 targetting nucleic acid may be used to creat lymphoma (NCL), immunocytoma (NNL), bulky low-grade or follicular non-cleave and inflammatory arthropathy. The NOGO-cleaved with the level of mother and inflammatory arthropathy. The NOGO-cleaved with a cell in particular, in the motificancy virus) associated NHL, mantle-cell immunocytoma (NNC), small B-cell lymphocytic lymphoma (NCL), immunocytoma (NNC), small B-cell lymphocytic lymphoma (NCL), immunocytoma (NNC), small B-cell lymphocytic lymphoma (NCC) or argetting nucleic acid may be contacted with a cell to reduce NOGO activity of the collect acid may be contacted with a cell to reduce NOGO activity of the collect and treat a patient having a condition associated with the level of the reatment may further comprise the use of one or more cell and treat a patient having a condition associated may be contacted with a cell collect acid may be contacted with a cell collect acid may be contacted with a cell collect acid with the lovel of creat central nervous system (CNS) injury and cerebrovascular ac

The present sequence is a degenerate PCR primer used for amplifying the human cell cycle checkpoint protein, hohki DNA. The cell cycle checkpoint protein, hohki DNA. The cell cycle cransitions, and enaure that critical events such as DNA replication and chromosome segregation are completed with high fidelity. The chti protein controls cell cycle in response to DNA damage. It functions as kinase and phosphorylates the key regulators of Cdk tycosine phosphorylation. The checkpoint gene sequences are used as probes for a portion of the chromosome associated with tumours and other malignancies, as well as growth and/or development deficiencies. The chkl proteins are useful for generating specific antibodies and for inhibiting growth of
                                                                                                                                                                                                                                                                                                                                                                    Human cell cycle checkpoint protein, hchkl DNA amplifying PCR primer #2.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        New Chkl proteins and gene sequences encoding the proteins useful as probes for a portion of the chromosome associated with tumors and other malignancies, growth and/or development deficiencies.

```
The invention relates to a purified polynuclectide (I) encoding a protein sequence (II) encoded by a novel human gene, otoferlin (OTOF) or the long human otoferlin isoform in brain. (I) was identified as underlying an autosomal nonsyndromic prelingual deafness DFNB9, and is thus useful for detecting deafness disease in humans and for characterising the functions of proteins and genes encoding them in auditory function. AAS95022-AAS95548 represent human and mouse otoferlin coding sequences, PCR

The present invention describes a human genome-derived myosin-like protein 1 (hGDMLP-1). The protein and polymucleotide sequences of hGDMLP-1 can be used as probes to detect, characterise and quantify nucleic acids can be used as probes to detect, characterise and quantify hGDMLP-1 nucleic acids in samples, as amplification substrates, to provide initial substrates for the recombinant engineering of hGDMLP-1 protein variants having desired phenotypic improvements, and for carrier as immunogens to raise antibodies that specifically recognise hGDMLP-1 proteins or polypeptides may be used as immunogens to raise antibodies that specifically recognise hGDMLP-1 proteins, as standards in assays used to determine the concentration and/or amount specifically of hGDMLP proteins, as specific biomolecule capture probes for surface-enhanced laser describing deficiency in hGDMLP-1 production, and in vaccines or for replacement therapy. The production, and in vaccines or for replacement therapy. The products sequences encoding hGDMLP-1 may be used for diagnosing a disorder associated with the expression of hGDMLP-1, in particular heart and skeletal muscle disorders. hGDMLP-1 is localised to chromosome 22. The present sequence represents an oligomer used in the screening of the hGDMLP-1 sequence data for this patent did not form part of the printed recombination, but was obtained in electronic format directly from WIPO captured and succession of the present section of the printed captured and succession of the present section of the printed captured and succession of the present sections.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  New polypeptide, for raising antibodies that recognize hdDMLP-1 proteins, or as specific biomolecule capture probes for surface-enhanced laser description ionization, comprises human myosin-like protein hdDMLP-1.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Shannon ME;

Disclosure; SEQ ID NO 67; 214pp; English.

The present invention describes a human genome-derived myosin-like protein 1 (hGDMLP-1). The protein and polymucleotide sequences of hGDMLP-1 claim be used in gene therapy and vaccine production. The hGDMLP-1 mucleic acids in samples, as amplification substrates to mucleic acids in samples, as amplification substrates, to provide initial substrates for the recombinant engineering of hGDMLP-1 protein variants having desired phenotypic improvements, and for provide initial substrates for the recombinant engineering of hGDMLP-1 proteins or polypeptides may be proteins variants having desired phenotypic improvements, and for expressing the proteins. The hGDMLP-1 proteins or polypeptides may be used as immunogens to raise antibodies that specifically recognise hGDMLP-1 proteins, as specific biomolecule and/or amount specifically of hGDMLP proteins, as specific biomolecule and/or amount specifically of hGDMLP proteins, as specific biomolecule corporation, and in vaccines or for replacement therapy. The production, and in vaccines or for replacement therapy. The production and vaccines or for replacement therapy. The production and skeletal muscle disorders. hGDMLP-1 may be used for diagnosing a disorder associated with the expression of hGDMLP-1 may be used for diagnosing a disorder sequence represents an oligomer used in the screening of the hGDMLP-1 sequence data for the exemplification of the present invention. N.B. The sequence data for this patent did not form part of the printed sequence data such published pot sequence

The present invention describes a human genome-derived myosin-like protein 1 (hGDMLP-1). The protein and polymucleotide sequences of hGDMLP-1 claim be used in gene therapy and vaccine production. The hGDMLP-1 claim be used as probes to detect, characterise and quantify hGDMLP-1 nucleic acids in samples, as amplification substrates, to provide initial substrates for the recombinant engineering of hGDMLP-1 protein variants having desired phenotypic improvements, and for expressing the proteins. The hGDMLP-1 proteins or polypeptides may be expressing the proteins. The hGDMLP-1 proteins or polypeptides may be and/or amount specifically of hGDMLP proteins as specific biomolecule and/or amount specifically of hGDMLP proteins, as specific biomolecule capture probes for surface-enhanced laser describion indistion, as therapeutic supplement in patients having specific deficiency in hGDMLP-1 production, and in vaccines or for replacement therapy. The production, and in vaccines or for replacement therapy. The production and in vaccines of for replacement therapy. The disorder associated with the expression of hGDMLP-1, in particular heart and skeletal muscle disorders. hGDMLP-1 is localised to chromosome 22. New polypeptide, for raising antibodies that recognize hGDMLP-1 proteins, or as specific biomolecule capture probes for surface-enhanced laser desorption ionization, comprises human myosin-like protein hGDMLP-1. protein variants having desired phenotypic improvements, and for expressing the proteins. The hGDMLP-1 proteins or polypeptides may be used as immunogens to raise antibodies that specifically recognise hGDMLP to teins, as standards in assays used to determine the concentration and/or amount specifically of hGDMLP proteins, as specific biomolecule capture probes for surface-enhanced laser desorption ionisation, as the reapeutic supplement in patients having specific deficiency in hGDMLP-1 production, and in vaccines or for replacement therapy. The production, and in vaccines or for replacement therapy. The production with the expression of hGDMLP-1, in particular heart and skeletal muscle disorders. hGDMLP-1 is localised to chromosome 22. The present sequence represents an oligomer used in the screening of the hGDMLP-1 sequence data for this patent did not form part of the printed specification, but was obtained in alectronic format directly from WIPO. The present invention describes a human genome-derived myosin-like protein 1 (hGDMLP-1). The protein and polynucleotide sequences of hGDMLP-1 can be used an gene therspy and vaccine production. The hGDMLP-1 nucleic acids in samples, as amplification substrates, to hGDMLP-1 nucleic acids in samples, as amplification substrates, to provide initial substrates for the recombinant engineering of hGDMLP-1 protein variants having desired phenotypic improvements and for expressing the proteins. The hGDMLP-1 proteins or polypeptides may be used as immunogens to raise antibodies that specifically recognise hGDMLP-1 proteins, as specific ally recognise hGDMLP-1 proteins, as specific biomolecule and/or amount specifically of hGDMLP proteins, as specific biomolecule and/or amount specifically of hGDMLP proteins, as specific biomolecule capture probes for surface-enhanced laser describing in hGDMLP-1 production, and in vaccines or for replacement therapy. The production, and in vaccines or for replacement therapy. The production and with the expression of hGDMLP-1 may be used for diagnosing a disorder associated with the expression of hGDMLP-1 may be used for chromosome 22. The present sequence represents an oligomer used in the screening of the hospitally. Requence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at fig. at ftp.wipo.int/pub/published_pct_eequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Human; genome-derived myosin-like protein 1; GDMLP-1; hGDMLP-1; heart; muscle; myosin; chromosome 22; gene therapy; vaccine; heart disease; skeletal muscle disorder; amplicon; screening; ss.

The present invention describes a human genome-derived myosin-like protein 1 (hGDMLD-1). The protein and polynucleotide sequences of hGDMLP-1 clan be used as probes to detect, characterise and quantify nucleic acids can be used as probes to detect, characterise and quantify hGDMLP-1 mucleic acids in samples, as amplification substrates, to provide initial substrates for the recombinant engineering of hGDMLP-1 protein variants having desired phenotypic improvements, and for expressing the proteins. The hGDMLP-1 proteins or polypeptides may be used as immunogens to raise antibodies that specifically recognise hGDMLP-1 proteins, as standards in assays used to determine the concentration and/or amount specifically of hGDMLP proteins, as specific biomolecule capture probes for surface-enhanced laser described in onisation, as therapeutic supplement in patients having specific deficiency in hGDMLP-1 production, and in vaccines or for replacement therapy. The production, and in vaccines or for replacement therapy. The adjaced sequences encoding hGDMLP-1 may be used for diagnosing a disorder associated with the expression of hGDMLP-1, in particular heart and skeletal muscle disorders, hGDMLP-1 is localised to chromosome 22.

The present sequence represents an oligomer used in the screening of the hGDMLP-1 sequence in the exemplification of the present invention. N.B. The sequence data for this patent did not form part of the printed by the protein but the manner of the printed forms but fo
                                                                                                                                                                                                                                                                                                                                       New polypeptide, for raising antibodies that recognize hGDMLP-1 proteins, or as specific biomolecule capture probes for surface-enhanced laser desorption ionization, comprises human myosin-like protein hGDMLP-1.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequence

New human kidney tumor overexpressed membrane (KTOM1) protein and nucleic acids encoding the protein, useful for treating subjects having defects in KTOM1 which can manifest as cancer of the kidney, or as a disorder of e.g., liver or bone.

Example 2; Page 179; 418pp; English.

The invention relates to a novel isolated nucleic acid encoding human KTOM1 (kidney tumour overexpressed membrane) protein. The protein of the invention has cytostatic activity. The nucleotide may have a use in gene therapy. The KTOM1 nucleic acids may be used to diagnose, treat or monitor a disease caused by altered expression of human KTOM1. Compositions comprising the nucleic acids, proteins or antibodies may be used to treat subjects having defects in KTOM1 which can manifest as cancer of the kidney, as well as a disorder of liver, bone marrow, brain, heart, lung, kidney, colon, skeletal muscle, testis, uterus and placenta function. The sequence represents a probe used in the invention to scan function. The sequence represents a probe used i the nt 1-1001 portion of human KTOM1a (ABQ63232)

```
The present invention relates to human testis expressed Patched like protein (HTPL, see ABV78759 to ABV78762 and ABB98519 to ABB98520). HTPL has two isoforms, with a few single base pair differences between the two. One of the single base pair changes introduces a premature stop codon in HTPL-S (S for short) compared to HTPL-L (L for long). HTPL shares an overall structure organisation with the Patched protein. The shared structural features strongly imply that HTPL plays a role similar to that of Patched, and is a potential tumour suppressor. HTPL is important in regulating male germ cell development, and the HTPL gene was maportant in regulating male germ cell development, and the HTPL, and in therapy and manufacture of a medicament for treatment or prevention of therapy and manufacture of a medicament for treatment or prevention of therapy and manufacture of a medicament for treatment or prevention of therapy and manufacture of a medicament for treatment or prevention of the such disorders include disorders of testis, or adrenal, adult and foretal liver, bone marrow, brain, kidney, lung, placenta, prostate, skeletal muscle or colon function. HTPL proteins and mucleic acids are clinically useful diagnostic markers and potenial therapeutic agents for male infertility and cancer. The present oligonucleotide was used in an example from the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Novel isolated human testis expressed Patched like protein (HTPL), useful for identifying agonist and antagonist and specific binding partners, and for treating subjects having defects in HTPL.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Example 2; Page 71; 718pp; English.

           New human kidney tumor overexpressed membrane (KTOM1) protein and nucleic acids encoding the protein, useful for treating subjects having defects in KTOM1 which can manifest as cancer of the kidney, or as a disorder of e.g., liver or bone.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             The invention relates to a novel isolated nucleic acid encoding human KTOM1 (kidney tumour overexpressed membrane) protein. The protein of the tinvention has cyrostatic activity. The nucleotide may have a use in gene therapy. The KTOM1 nucleic acids may be used to diagnose, treat or monitor a disease caused by altered expression of human KTOM1.

Compositions comprising the nucleic acids, proteins or antibodies may be used to treat subjects having defects in KTOM1 which can manifest as cancer of the kidney, as well as a disorder of liver, bone marrow, brain, heart, lung, kidney, as well as a disorder of liver, bone marrow, brain, theart, lung, kidney, colon, skeletal muscle, testis, uterus and placenta function. The sequence represents a probe used in the invention to scan the nt 1-1001 portion of human KTOM1a (ABQ631232)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Query Match 0.8%; Score 13.4; DB 1; Length 17; Best Local Similarity 93.3%; Pred.                                                                                                                                                                                                                                                                                                                                                                       The present invention relates to human testis expressed Patched like protein (HTPL, see ABV78759 to ABV8762 and ABB9B19 to ABB98520). HTPL has two isoforms, with a few single base pair differences between the two. One of the single base pair changes introduces a premature stop codon in HTPL-S (S for short) compared to HTPL-L (L for long). HTPL shares an overall structure organisation with the Patched protein. The shares an overall structure organisation with the Patched protein. The chare of Patched, and is a potential tumour suppressor. HTPL is important in regulating male germ cell development, and the HTPL gene was mapped to human chromosome 10pl2.1. HTPL and its coding sequence are useful for diagnosing a disorder caused by mutation in HTPL, and in the useful for diagnosing a disorder caused by mutation in HTPL, and in the useful for diagnosing disorder caused by mutation of activity of human HTPL. Such disorders include disorders of testis, or adrenal, adult and foetal liver, bone marrow, brain, kidney, lung, placenta, prostate, skeletal muscle or colon function. HTPL proteins and nucleic adids are called infermility and cancer. The present oligonucleotide was used in an entire of the present oligonucleotide was used in an
                                                                                                                                                                                                                                                                                   Novel isolated human testis expressed Patched like protein (HTPL), useful for identifying agonist and antagonist and specific binding partners, and for treating subjects having defects in HTPL.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Human; hammerhead ribozyme; cytostatic; antitumour; antidiabetic; ophthalmological; antiarthritic; antipsoriatic; virucide; osteopathic; vulnerary; cancer; lymphoma; Ewing's sarcoma; melanoma; psoriasis; tumour angiogenesis; diabetic retinopathy; macular degeneration; neovascular glaucoma; myopic degeneration; arthritis; verruca vulgaris; angiofibroma of tuberous sclerosis; port-wine stain; wound healing; Sturge Weber syndrome; Kippel-Trenaunay-Weber syndrome; leukaemia; ss;

The invention relates to a nucleic acid molecule (I) which down regulates expression of an Ets-related gane (BRG). (I) is useful for treating conditions selected from cancer, lymphoma, Exing's sarcoma, melanoma, conditions selected from cancer, lymphoma, Exing's sarcoma, melanoma, relating a sarcoma, melanoma, myopic degeneration, arthritis, psoriasis, verruca neovascular glaucoma, Mippel-Trenamay-Weber syndrome, Osler-Meber-rendu syndrome, leukaemia, osteoporosis and wound healing. (I) is useful for treating a patient having a condition associated with the level of ERG, by contacting cells of the patient with (I) under conditions suitable for the treatment. The method comprises the use of one or more therapies conditions suitable for the treatment. Leukaemia or tumour conditions suitable for the therapies such as radiation or conjunction with one or more of other therapies such as radiation or conjunction with one or more of other therapies such as radiation or conjunction with cone or more of chert therapies such as radiation or calion such as Mg2+. (I) is useful for reducing ERG activity in a cell of live presence of ERG RNA in a cell. (I) is useful for specifically cated metations within diseased cells or to detect the presence of ERG RNA in a cell. (I) is useful for specifically capaesting genes that share homology with ERG gene or ERG fusion genes. ABRX7354-ABRZ279 represent nucleic acids molecules which regulate expression of ERG, and confinent and contaction capaes in the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Novel polynucleotide which down regulates expression of Bts-related gene, useful for treating cancer, diabetic retinopathy, macular degeneration, arthritis, psoriasis, verruca vulgaris and Sturge Weber syndrome.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        RESULT 1468
```

```
This invention describes a novel isolated nucleic acid that encodes one of three new isoforms of human pregnancy associated plasma protein E, harper-E: The products of the invention have abortive and contraceptive activity and can be used for gene therapy or in a vectine. The nucleic acid, polypeptide encoded by it, or antibody to the polypeptide can be used in pharmaceutical compositions or vaccines for preventing or aborting pregnancy. PAPP-E is used in the antenatal diagnosis of dysgenetic pregnancies. The nucleic acids are used as probes to assess the level of PAPP-E isoform mENA in chorionic villus samples, and the antibodies can be used to assess the expression levels of PAPP-E isoform proteins in chorionic villus samples, to diagnose dysgenetic pregnancies antenatally. This sequence represents an oligomer used in scanning the human PAPP-E genes described in the disclosure of the invention

The invention relates to an isolated SH3 domain (POSH)-like signalling protein 1 (POSHL 1) polypeptide (I), comprising a sequence of 730 amino acids (SI, ABB3999), a sequence having 65% sequence identity to (SI), acids (SI), having 95% deviations, especially conservative substitutions or a fragment of the sequences comprising at least 8 contiguous amino acids. Human POSHL 1 is a proto-oncogene product that functions as an adapted protorin that interacts with Rho family small GTPases as well as downstream components of the signal transduction pathway. (I) is useful of for identifying a specific binding partner. (I) and mucleic acids (II) for identifying a specific binding partner. (I) and mucleic acids (II) caused by altered expression of human POSHL1 including disposing and caused by altered expression of human POSHL1 including disposing and creating causeful for measuring and for surveying gene expression and creating are useful for measuring and for surveying gene expression and creating creases t sequence is that of a scanning oligomorlectic useful in examples of the invention. Note: The present sequence did not form part of the printed specification, but is based on sequence information supplied to be between the part of the control of the European Patent Office
                                                                                                                                                                                                                                                                                                                        Novel human SH3 domain (POSH)-like signaling protein 1 polypeptide, POSHL-1, useful for treating disorders associated with decreased expression or activity of human POSHL1.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Human; FOSHL 1; SH3 domain; POSH-like signalling protein 1; oncogene; Rho GTPase; signal transduction; gene expression; cancer; vaccine; gene therapy; transgenic; ss.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           1472
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             ABV90265
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           RESULT
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               8
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          셤
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             The invention relates to an isolated SH3 domain (POSH) like signalling protein 1 (POSHL 1) polypeptide (I), comprising a sequence of 730 amino acids (SI, ABB83999), a sequence having 55% sequence lathing to (SI), (SI) having 95% deviations, especially conservative substitutions or a fragment of the sequences comprising at least 8 contiguous amino acids. Human POSHL i is a proto-oncogene product that functions as an adaptor protein that interacts with Rho family small GTPases as well as downstream components of the signal transduction pathway. (I) is useful for identifying a specific binding partner. (I) and nucleic acids (II) encoding (I) are useful for diagnosing, monitoring disease and treating cancer, they useful in the development of vaccines and (II) is useful in gene therapy. (II) is useful for constructing mincraarrays which are useful for measuring and for surveying gene expression and creating transgenic non-human animals capable of producing the proteins. The present sequence is that of a scanning oligonuclectide useful in examples of the invention. Note: The present sequence did not form part of the printed specification, but is based on sequence information supplied to betwent by the Buropean Patent Office
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             ·,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Human; POSHL 1; SH3 domain; POSH-like signalling protein 1; oncogene; Rho GTPase; signal transduction; gene expression; cancer; vaccine; gene therapy; transgenic; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             ô

Human, POSHL 1, SH3 domain, POSH-like signalling protein 1; oncogene; Rho GTPase, signal transduction, gene expression; cancer; vaccine; gene therapy; transgenic; ss.

Human POSHL1 scanning oligonucleotide SEQ ID NO 978.

```
The invention relates to an isolated SH3 domain (POSH) like signalling protein 1 (POSHL 1) polypeptide (I), comprising a sequence of 730 amino acids (SI, ABBR399), a sequence having 65% sequence identity to (SI), acids (SI, ABBR399), a sequence having 65% sequence of fantity to (SI), acids (SI, ABBR399), a sequence having 65% sequence identity to (SI), acids of the sequence scomprising at least 8 contiguous amino acids. Human POSHL I is a proto-oncogene/oncogene product that functions as an adaptor protein that interacts with Rho family small GTPases as well as downstream components of the signal transduction pathway. (I) is useful for identifying a specific binding partner. (I) and nucleic acids (II) encoding (I) are useful for diagnosing monitoring disease and treating caused by altered expression of human POSHL1 including diagnosing and treating cancer, they useful in the development of vaccines and (II) is useful in gene therapy. (II) is useful for constructing microarrays which are useful for measuring and for surveying gene expression and creating transgenic non-human animals capable of producing the proteins. The present sequence is that of a scanning oligonuclectide useful in examples of the invention. Note: The present sequence did not form part of the printed specification, but is based on sequence information supplied to berwent by the European Patent Office
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Novel human SH3 domain (POSH)-like signaling protein 1 polypeptide, POSHL -1, useful for treating disorders associated with decreased expression or activity of human POSHL1.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  .

```
The invention relates to an isolated SH3 domain (POSH)-like signalling protein 1 (POSH1 1) polypeptide (I), comprising a sequence of 730 amino acids (SI, ABB8399), a sequence having 65$ sequence identity to (SI), (SI) having 95$ deviations, especially conservative substitutions or a fragment of the sequences comprising at least 8 contiguous amino acids. Human POSH1 is a proto-oncogene/oncogene product that functions as an adaptor protein that interacts with Rho family small Greases as well as downstream components of the signal transduction pathway. (I) is useful of for identifying a specific binding partner. (I) and nucleic acids (II) encoding (I) are useful for diagnosing, monitoring disease and treating cancer, they useful in the development of vaccines and (II) is useful in gene therapy. (II) is useful for constructing microarrays which are useful for measuring and for surveying gene expression and creating cancer, they useful in suseful for constructing microarrays which are useful for measuring and for surveying gene expression and creating present sequence is that of a scanning oligonucleotide useful in examples of the invention. Note: The present sequence did not form part of the parameth, the content of the parameth the acid on sequence information supplied to parameth.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Novel human SH3 domain (POSH)-like signaling protein 1 polypeptide, FOSHL-1, useful for treating disorders associated with decreased expression or activity of human POSHL1.
          Human; POSHL 1; SH3 domain; POSH-like signalling protein 1; oncogene; Rho GTPase; signal transduction; gene expression; cancer; vaccine;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Query Match 0.8%; Score 13.4; DB 1; Length 17; Best Local Similarity 93.3%; Pred.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          The invention relates to an isolated SH3 domain (POSH)-like signalling protein 1 (POSH1 1) polypeptide (1), comprising a sequence of 730 amino acids (S1, ABB83999), a sequence having 65$ sequence of 611, (S1) having 95$ deviations, especially conservative substitutions or a fragment of the sequences comprising at least 8 contiguous amino acids. Human POSH1 is a proto-onogene/oncogene product that functions as an adaptor protein that interacts with Rho family small GTPases as well as downstream components of the signal transduction pathway. (I) is useful of for identifying a specific binding partner. (I) and muddeic acids (II) encoding (I) are useful for diagnosing, monitoring disease and traating canced by altered expression of human POSH1 including diagnosing and treating cancer, they useful in the development of vaccines and (II) is useful in gene therapy. (II) is useful for constructing microarrays which are useful for measuring and for surveying gene expression and creating care useful for measuring and for surveying gene expression and exacting resent sequence is that of a scanning oligonuclectide useful in examples of the invention. Note: The present sequence did not form part of the partner of the partner have the provence of the partner of the partner who the partner of the partner have the partner of the partner that the partner of the partner have the partner of the partner have not the partner of the partner have not a scanning on sequence information supplied to
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            ô
